W. & L. E. GURLEY'S INSTRUMENT MANUFACTORY.—ESTABLISHED 1845.

ESTABLISHED, 1845.

INCORPORATED, 1900.

1845-1905.

PREFACE TO THE THIRTY-EIGHTH EDITION.

AUGUST, 1905.

N EARLY SIXTY YEARS AGO the manufacture of Civil Engineers' and Surveyors' instruments was begun in this city by Jonas H. Phelps and William Gurley. Mr. Phelps retiring some years later, Lewis E. Gurley formed with William Gurley the firm of W. & L. E. Gurley; and under this name the business has since been conducted.

The first edition of GURLEY'S MANUAL was published in 1855, a book of seventy pages. It was well received, and was the first really practical treatise on the use and adjustment of Civil Engineers' and Surveyors' instruments.

The revised and enlarged MANUAL is used as a textbook in many schools and colleges, and is freely quoted in technical publications.

The capacity of the factory has been increased as the demands of the profession have grown during the half century, until we are now the most extensive manufacturers of Civil Engineers' and Surveyors' instruments in the world.

We expect to have our instruments judged upon their merits, and any Surveyor or Civil Engineer who will carefully examine our work will be pleased with it.

W. & L. E. GURLEY,
TROY, N. Y., U. S. A.

TRANSIT-INSTRUMENTS.

THE AMERICAN TRANSIT, in its various modifications, is by far the most important of all the instruments used in engineering. The essential parts, as shown in the cuts, are the Telescope with its axis, the two standards, the Circular Plates with their attachments, the Sockets upon which the plates revolve, the Leveling-Head, and the Tripod upon which the whole instrument stands

The Telescope is from ten to eleven inches long, firmly secured to an axis having its bearings nicely fitted in the standards, enabling the telescope to transit. The different parts of the telescope are shown on page 7.

The object-glass is a compound lens, achromatic, and showing objects without distortion, and is placed at the end of a slide having two bearings, one
OBJECT-GLASS. at the end of the outer tube, the other in the ring, C C, suspended within the tube by four screws, only two of which are shown in the cut.

In Transits Nos. 1 to 90 both object-glass and eyepiece are moved out or in by pinions working in racks attached to their slides, and are thus adjusted to proper focus.

The eyepiece is made up of four lenses, which, beginning at the eye end, are called respectively the eye, the field, the amplifying, and the object lens,
EYEPIECE. the whole forming a compound microscope having its focus in the plane of the cross-wire ring, B B.

In Transits Nos. 100 to 105 the eyepiece is focused by a spiral movement.

**No. 12.**

Engineers' Transit, two verniers to limb, with 5-inch needle, plain telescope and tripod.
Price as shown, \$150.00.

Sometimes an eyepiece with two lenses is employed; but this, while it gives more light, inverts the image of the object seen, and is rarely used by American engineers.

The object-glass, receiving the rays of light which proceed from all the points of a visible object, converges them to a focus at the cross-wires, and there forms a minute, inverted image, which may be seen by placing a piece of ground glass to receive it at that point.

The eyepiece, acting as a compound microscope, magnifies this image, restores it to its natural position, and conveys it to the eye.

The visual angle which the image there subtends is as many times greater than that which would

be formed without the use of the telescope, as the number which expresses its magnifying power is greater than unity. Thus, a telescope which magnifies twenty times increases the visual angle just as much, and therefore diminishes the apparent distance of the object twenty times; or, in other words, it will show an object two hundred feet distant with the same distinctness as if it were only ten feet distant from the naked eye

It might be supposed that the greater the power of a telescope the better ; but, beyond a certain limit, this is found to be incorrect. As only a given **HIGH POWERS.** amount of light can enter the object-glass, the more the object is magnified the less clear and bright will it appear. We have found that a power of from twenty to twenty-four diameters in the telescopes of Transits gives the best results, and is sufficient for all ordinary practice.

The cross wires are two wires of very fine platinum, cemented into the cuts on the sur-
CROSS-WIRES face of a metal ring.

They are placed at right angles with each other, so as to divide the open space in the center into quadrants.

To remove the cross-wire ring, take out the eyepiece together with the little ring by which it is centered, and having removed two opposite cross-wire screws, with the others turn the ring until one of the screw holes is brought into view from the open end of the telescope tube ; in this screw hole thrust a pointed splinter of wood or a small wire, to hold the ring when the remaining screws are withdrawn ; the ring can then be taken out. It may be replaced by returning it to its position in the tube, and when either pair of screws is inserted, the splinter or wire is removed, and the ring is turned until the other screws can be replaced.

Care must be taken that the face of the diaphragm is turned toward the eyepiece. When this has been done, the eyepiece is inserted, and its centering-ring brought into such a position that the screws in it can be replaced, and, then, after screwing to the end of the telescope the

ring into which the eyepiece is fixed, the operation will be complete.

The advantage of platinum over spider-web for the cross wires of telescopes has long been conceded, but the difficulty of procuring it of sufficient fineness has prevented its general use. We are successfully drawing platinum wires of from one eight-thousandth to one thirty-thousandth of an inch in diameter, and are using them in the telescopes of all our instruments. These wires are perfectly opaque, and, of course, entirely unaffected by moisture; and are universally preferred to the spider-web heretofore used.

The intersection of the wires forms a minute point which, when adjusted, determines the optical axis of the telescope and enables the surveyor to fix it upon an object with the greatest precision. The imaginary line passing through the optical axis of the telescope is called the "line of collimation," and the operation of bringing the intersection of the wires into the optical axis is called the "adjustment of the line of collimation." This is described on pages 20-22.

The openings in the telescope tube are made larger than the screws used in adjusting the cross-wires, so that, when the screws are loosened, the ring can be rotated for a short distance in either direction. The object of this will be seen more plainly when we describe the means by which the wire is made truly vertical.

The sectional view of the telescope also shows two movable rings, one placed at A A, the other at C C, which are used respectively in centering the eyepiece and in the adjustment of the object-glass slide.

The centering of the eyepiece is performed after the wires have been adjusted, and is effected by moving the

ring, by means of the screws shown on the outside of the tube, until the intersection of the wires is brought into the center of the field of view.

The adjustment of the object-glass slide, which is described on page 23, keeps the line of collimation in adjustment through the whole range of the slide, preventing, at the same time, what is called the "traveling" of the wires. This adjustment, which is peculiar to our telescopes, is always made in the process of construction, and needs no further attention from the engineer.

The Stadia is a compound cross-wire ring or diaphragm,

as shown, having
STADIA. three horizontal wires, of which the middle one is cemented to the ring as usual, while the others are fastened to slides, held

apart by springs and actuated by independent screws, by which the distance between the two movable wires can be adjusted to include a given space, as one foot on a rod one hundred feet distant.

These wires will in the same manner include two feet on a rod two hundred feet distant, or half a foot at a distance of fifty feet, and so on in the same proportion, thus furnishing a means of measuring distances, especially over broken ground, more easily and even more accurately than with a tape or chain. We put stadia wires in all Transit telescopes without extra cost, if requested when the instrument is ordered.

While more convenient to make stadia measurements from the center of the instrument, the increasing use of the stadia demanding measurements made with the utmost ac-

curacy and for shorter distances compels the use of the "constant"; that is, the wires are adjusted to read one foot on the rod at a distance from the center of the instrument of 100 feet plus c plus f ; c being the distance of the object-glass from the center of the instrument, found by measuring from the center of the axis to the shoulder of the setting of the object-glass when it is focused on a distant object; and f being the focal length of the object-glass, found by measuring from the cross-wires to the object-glass.

The reason of this is because the rays cross each other so that the vertex of the visual angle is not at the center of the instrument but at a distance in front of the objective equal to its focal length.

The "constant" for each instrument, or distance of the zero of the indicated distance in front of the center of the instrument, is noted on a card placed on the inside of the instrument box.

For example, in our eleven-inch telescopes, such as are used with our larger transits, $c=5.6$ inches and $f=8.2$ inches; $c+f=1.15$ feet. In our Mountain Transit telescopes, $c=4$ inches and $f=5.4$ inches; $c+f=0.783$ feet. In our Reconnaissance Transit telescopes, $c=4.25$ inches and $f=5.75$ inches; $c+f=0.833$ feet.

The stadia wires are ordinarily arranged so that they are seen at the same time as the cross-wires. We arrange **DISAPPEARING** them, when desired, so that they are out of focus when the main wires are visible, **STADIA.** or vice versa. Many engineers prefer this method, as being less confusing to the observer and lessening the liability for errors in observation.

FIXED The stadia wires are *fixed*, when desired, on **STADIA.** the same ring with the cross-wires. In such case the customer should clearly specify whether he wishes to

measure distances from the center of the instrument, or to use a "constant."

The Dust-Guard to the object-glass slide, as seen in the cut, is placed on the telescopes of Transits Nos. 1 to 90, and Nos. 110 to 117. This guard effectively

DUST-GUARD. shields the object-glass slide, and prevents any dust or foreign substance from interfering with the perfect action of the slide. The cost of placing the guard on an old Transit of our manufacture is \$4.00.

No. 154.

With the telescope of the ordinary Transit it is impossible to focus on objects at a distance of less than ten feet.

SHORT FOCUS. In order to overcome this difficulty and to enable the observer to see objects near the instrument, we have recently introduced an important modification of the telescopes used on Transits Nos. 1-90, so that they can be focused on an object at a distance of about four and one-half feet from the instrument.

To enable the Transit, when desired, to be set under a **CENTER POINT.** given point, we now place in the top of the ball of the telescope axis and directly over the center of the instrument a small conical hole or "center point."

The Standards of the Transit are firmly attached by their expanded bases to the upper plate, one of them having near the top, as shown on page 38, a little **STANDARDS.** box, actuated by a screw underneath, by which the telescope axis is made truly horizontal, as described on page 22.

The Magnetic Needle is from three and one-half to six

inches long in the different sizes of Transits, its brass cap **MAGNETIC** having inserted in it a jeweled-center of special **NEEDLE.** shape and perfectly polished, and this, resting upon the hardened and polished point of the center-pin, allows the needle to play freely and settle in the magnetic meridian.

The needle has its north end designated by a scollop or other mark, and on its south end is a small coil of fine brass wire, easily moved so as to bring both ends of the needle to the same level. The needle is lifted from the pin by a lever concealed underneath the upper plate, actuated by a screw shown above, thus raising the button so as to check the vibration of the needle, or bring it up against the glass when not in use, and avoid the unnecessary wear of the pivot.

The form of the needle is varied according to the taste or fancy of the maker or surveyor, but may be resolved into two general classes, one having the greatest breadth in a horizontal, the other in a vertical, direction.

We usually make our needles about eight one-hundredths of an inch broad, and about three one-hundredths of an inch thick, with the ends brought to a sharp vertical edge; but whenever desired we supply other forms.

The test of the delicacy of a magnetic needle is the number of horizontal vibrations which it will make in a certain arc before coming to rest; besides this, most surveyors prefer to see also a quivering motion.

This quality, which is manifested more in a horizontal than in a vertical needle, depends upon the near coincidence of the point of suspension with the center of gravity of the needle, and merely serves to show that the cap is unobstructed.

The compass-box containing the needle is covered by a glass to exclude the moisture and air; the circle is silvered

and graduated on its upper surface into degrees and half degrees, and figured from 0 to 90 on each side of the line of zeros ; the degree marks are also cut down on the inner edge.

An arc, for setting off the declination of the needle, is furnished with any new Engineers' Transit,
VARIATION ARC. Nos. 1 to 16, if ordered with the instrument, at an extra cost of \$4.00.

The Clamp and Tangent movement has its tangent
CLAMP AND TANGENT. screw with opposing spring attached to the upper plate, as shown on page 6 ; the clamp is shown in the sectional cut on page 15, being a strong metal ring, D F, moving easily around the outer socket, to which it is securely fixed at will by a clamp-screw, E, impinging upon a segment, F. By this means the plates are clamped, and moved slowly around each other in either direction by the tangent screw, or loosened at will and moved by the hand, the telescope being thus easily and accurately directed to the point of sight.

The two levels are placed at right angles with each other so as to level the plate in all directions, and are adjusted by turning the capstan-head nuts
PLATE-LEVELS. at their ends by a small steel adjusting-pin. The glass vials used in the levels of all our Transits are ground on their interior surface, so as to give the bubble an even motion and great sensitiveness.

The Lower Plate, or Limb (at B in the cut on page 15)
HORIZONTAL LIMB. is graduated on its upper surface, usually into degrees and half degrees, and figured in two rows, from 0 to 360 and from 0 to 90 each way ; sometimes but a single series is used, and then the figures run from 0 to 360 or from 0 each way to 180. The figuring may be varied according to the wish of the person ordering

the instrument, the double series being always used unless otherwise specified.

The Verniers, V V, are attached to the upper plate diametrically opposite to each other, and are used in reading the limb within which they revolve.

The verniers are double, having on each side of the zero mark thirty equal spaces corresponding precisely with twenty-nine half degrees of the limb; they thus read to single minutes, and the number passed over is counted in the same direction in which the vernier is moved.

The verniers are placed in front of the observer and at an angle of thirty degrees with the telescope, so that they are easily read without a change of position.

THE SOCKETS AND CIRCULAR PLATES.

The use of two opposite verniers gives the means of cross-questioning the graduations, the perfection with which they are centered and the dependence which can be placed upon the accuracy of the angles indicated

Sometimes a smaller reading than minutes is desired, and then the spaces of the limb and vernier are both made proportionately less, so as to give readings to thirty, twenty, or even ten seconds of arc, if required. The vernier openings are covered with glass, carefully cemented to exclude moisture and dust.

Reflectors of celluloid, as in the Mountain Transit, are often used to throw white light upon
REFLECTORS. the graduations, and shades of ground glass are sometimes used to give a more subdued light.

The Graduations were formerly made on the brass surface of the limb, afterward filled with black wax, and then finished and silvered. The limbs of
GRADUATIONS. all our Transits are now covered with sterling silver; the graduations are much finer and more distinct, and the surfaces less liable to become tarnished.

This improvement, which costs quite a large sum, we make without additional charge.

To make possible the utmost accuracy of graduation, the limbs of our Transits are polished and the figures engraved before cutting the divisions, thus avoiding any possible chance for molecular change after the graduation is made.

The Sockets of the Transit are compound; the interior spindle attached to the vernier plate turning in the exterior
SOCKETS. socket, C, when an angle is taken on the limb; but when the plates are clamped together the exterior socket itself, and with it the whole instrument, revolves in the socket of the leveling-head.

The sockets are made with the greatest care, the surfaces being truly concentric with each other, and the composition of which they are made being of different degrees of hardness, so as to cause them to move upon each other easily and with the least possible wear.

The Leveling-head consists of two plates connected by a socket, having at its end a hemispherical nut fitting into a corresponding cavity in the lower plate.

LEVELING-HEAD. The plates are inclined to each other or made parallel at will by four leveling-screws.

We also make the leveling-head with three leveling-screws, but made to order only.

The screws are of bronze, and are fitted to long nuts in the upper leveling plate. They are protected from dust by brass covers screwed on the upper ends of the nuts.

The screws rest in cups or sockets, in which they turn without marring the surface of the lower plate, the cups also permitting the screws to be shifted from side to side, or turned in either direction on the lower plate.

The clamp and tangent movement of the leveling-head, partially shown on page 6, serves to turn the whole instrument upon its sockets, so as to fix the telescope with precision upon any given point, and when unclamped allows it to be directed approximately by hand. The tangent screw is single, as shown, and has an opposing spring by which lost motion is avoided and a very fine and prompt movement secured.

The lower leveling-plate is made in two pieces, the upper one, which is screwed fast to the top of the tripod, having a large opening in the center, in which the smaller lower plate is shifted from side to side. By this simple arrangement, called a "shifting

center," the instrument is easily moved over the upper plate, and the plummet which hangs from the center, P (see page 15), may be set precisely over a point without moving the tripod.

The Tripod has a head of bronze with three strong tenons to receive the legs, the upper ends of which are pressed firmly on each side of the tenon by a
TRIPOD. bolt and nut on opposite sides of the leg ; the nut can be screwed up at will, and thus kept firm.

The lower end of the leg has a brass shoe with steel point, securely fastened and riveted to the wood.

For various patterns of tripods see pages 176-179.

TO USE THE TRANSIT.

The instrument should be set up firmly, the tripod legs being pressed into the ground, so as to bring the plates as nearly level as convenient ; the plates should then be carefully leveled and properly clamped.

For precise work, in addition to leveling by the plate levels, it is always advisable, if the Transit has such attachment, to level the plates by the telescope level, as this is much more sensitive than the levels on the plate. It must be carefully noted that in this operation the position of the level on telescope must be observed over both sets of leveling-screws, and one-half the correction made by the axis tangent, the other half by the leveling-screws.

The zeros of the verniers and limb should be brought into line by the tangent screw of the plates and the telescope directed to the object by the tangent screw of the leveling head. The angles taken are then read off upon the limb, without subtracting from those given by the verniers in any other position.

Before an observation is made with the telescope, the eyepiece should be focused by its pinion until the cross-wires appear distinct to the eye of the observer ; the object-glass is then focused by its pinion until the object is seen clear and well-defined, and the wires appear as if fastened to its surface.

The intersection of the wires (the means by which the optical axis of the telescope is defined) should be brought precisely upon the middle of the object to which the instrument is directed.

TO ADJUST THE TRANSIT.

Every instrument should leave the hands of the maker in complete adjustment, but all are so liable to derangement by accident or careless use that we deem it necessary to describe particularly those adjustments which are most likely to need attention.

The principal adjustments of the Transit are: THE LEVELS.—THE LINE OF COLLIMATION.—THE STANDARDS.

To adjust the Levels: Set up the instrument upon its tripod as nearly level as may be, and having unclamped the plates, bring the two levels above, and
THE LEVELS. on a line with, the two pairs of leveling-screws ; then with the thumb and first finger of each hand clasp the heads of two opposite screws, and, turning both thumbs in or out, as may be needed, bring the bubble of the level directly over the screws, exactly to the middle of the opening. Without moving the instrument, proceed in the same manner to bring the other bubble to the middle ; after doing this the level first corrected may be thrown a little out ; bring it in again ; and when both are in place turn the instrument half-way around ; if the bubbles are

both in the middle, they need no correction ; but if not, with the adjusting-pin turn the small nuts at the end of the levels until the bubbles are moved over half the error ; then bring the bubbles again into the middle by the leveling-screws ; and repeat the operation until the bubbles will remain in the middle during a complete revolution of the instrument, when the adjustment will be complete.

To adjust the Line of Collimation : This adjustment is to bring the cross-wires into such a position that the instrument, when placed in the middle of a straight line, will, by the transit of the telescope, cut the extremities of the line. Then, having the instrument leveled, determine if the vertical wire is plumb, by focusing on a defined point and observing if the wire remains on that point when the telescope is elevated or depressed. If not, loosen the cross-wire screws and by their heads turn the ring until correct. Then direct the intersection of the cross-wires on an object two or three hundred feet distant. Set the clamps and transit to an object found or placed about the same distance in the opposite direction. Unclamp, and turn the plates half way around and direct again to the first object and then transit to the second object. If it strikes the same place the adjustment is correct.

If not, however, the space which separates the wires from the second point observed will be double the deviation of that point from a true straight line, which may be conceived as drawn through the first point and the center of the instrument, since the error is the result of two observations made with the wires when they are out of the optical axis of the telescope.

In the cut on page 21, let A represent the center of the instrument, and B C the imaginary straight line, upon

the extremities of which the line of collimation is to be adjusted.

B represents the object first selected, and D the point which the wires bisected when the telescope was reversed.

When the instrument is turned half around, and the telescope again directed to B, and once more reversed, the wires will bisect an object, E, situated as far to one side of the true line as the point, D, is on the other side. The space, D E, is therefore the sum of two deviations of the wires from a true straight line, and the error is made very apparent.

In order to correct it, use the two capstan-head screws on the sides of the telescope, these being the ones which affect the position of the vertical wire.

Remember that the eyepiece inverts the position of the wires, and therefore that in loosening one of the screws and tightening the other on the opposite side, the operator must proceed as if to increase the error observed.

The wires being adjusted, their intersection may now be brought into the center of the field of view by moving the screws, A A, shown in the sectional view of the telescope, page 7, which are slackened and tightened in pairs, the movement being now direct, until the wires are seen in their proper position.

It is here proper to observe that the position of the line of collimation depends upon that of the objective solely, so that the eyepiece may, as in the case just described, be moved in any direction, or even entirely removed and a new one substi-

tuted, without at all deranging the adjustment of the wires.

To adjust the Standards : In order that the point of intersection of the wires may trace a vertical line as the telescope is directed up or down, it is necessary that both the standards of the telescope should be of precisely the same height To ascertain this, and make the correction, if needed, proceed as follows :

Having the line of collimation previously adjusted, set up the instrument in a position where points of observation, such as the point and base of a lofty spire, can be selected, giving a long range in a vertical direction.

Level the instrument, direct the telescope to the top of the object, and clamp to the spindle ; then bring the telescope down until the wires bisect some good point, either found or marked at the base ; turn the instrument half around, direct the telescope to the lower point, clamp to the spindle, and raise the telescope to the highest point. If the wires bisect it, the vertical adjustment is effected ; if they are thrown to either side, this proves that the standard opposite to that side is the highest, the apparent error being double that actually due to this cause. To correct it, we make one of the bearings of the axis movable, so that by turning a screw underneath this sliding piece, as well as the screws which fasten the cap of the standard, the adjustment is made with the utmost precision. This arrangement, which is common to all of our Transits, is very substantial and easily managed.

Besides the three adjustments already described, which are all that the surveyor will ordinarily be required to make, there are *other adjustments* of the Transits which may sometimes be required.

To adjust the Object-glass Slide : Having set up and

leveled the instrument, the line of collimation being also **OBJECT-GLASS** adjusted for objects from three hundred **SLIDE.** to five hundred feet distant, clamp the plates, and fix the vertical cross-wire upon an object as distant as may be distinctly seen ; then, without disturbing the instrument, move out the object-glass so as to bring the vertical wire upon an object as near as the range of the telescope will allow. Having this clearly in mind, loosen the upper clamp, turn the instrument half-way around, reverse the telescope, clamp the instrument, and with the tangent screw bring the vertical wire again upon the near object; then draw in the objective until the distant object first sighted upon is brought into distinct vision. If the vertical wire strikes the same line as at first, the slide is correct for both near and remote objects and, being itself straight, for all distances

But, if there is an error, proceed as follows : First, with the thumb and forefinger twist off the thin brass tube which covers the screws, C C (see page 7). Next, with the screw-driver, turn the two screws, C C, on the opposite sides of the telescope, loosening one and tightening the other so as to apparently increase the error, making, by estimation, one-half the correction required. Then go over the usual adjustment of the line of collimation and, having it completed, repeat the operation above described, first sighting upon the distant object, then finding a near one in line, and then reversing, making correction, etc., until the adjustment is complete.

This adjustment is always made by us before the instrument is shipped, is peculiar to our Transits, and, in our experience, furnishes the only way in which the line of collimation can be made correct for all distances.

The adjustments of the vertical circle and the level on telescope are described on pages 49-54.

THE ENGINEERS' TRANSIT.

THE LEVELING-HEAD of the Engineers' Transit is secured to the sockets by a screw and washer below ; it can be removed for cleaning and oiling, but should be in place when the instrument is in use or packed for transportation.

The circular plates, with their accompanying sockets, are shown in section on page 15. The upper plate, A A, carrying the compass-circle is screwed fast to the flange of the interior spindle ; the lower plate or divided limb, B, is fastened to the exterior socket, C, which again is fitted to and turns in the hollow socket of the leveling-head.

To take apart the Engineers' Transit : When it is necessary to separate the plates of the Transit, the engineer should proceed as follows :

(1) Remove the screw and washer underneath, which secure the leveling-head to the sockets.

(2) Unscrew the nut which confines the spring in the thimble opposed to the tangent screw on the upper plate.

(3) Take out the three small screws which attach the tangent fixture to the upper plate. The plates can then be readily separated. To put the Transit together again, proceed exactly the reverse of the operation thus described.

The engraving, page 26, shows some of the attachments often used with the Engineers' Transit ; the vertical **ATTACHMENTS** arc, level on telescope, and clamp and **TO TRANSITS.** tangent to telescope axis with gradienter screw. These and other appliances are used where leveling, taking vertical angles, etc., must be done in connection

No. 16.

Engineers' Transit, two verniers to limb, 5-inch needle, with 6-inch vertical arc and vernier moved by tangent screw and reading to 30 seconds, level on telescope, gradienter combined with clamp and tangent, and tripod.
 Price as shown, \$198.00.

with the ordinary work of the Transit, and the attachments and their adjustments are described on pages 48-69.

We make three sizes of the Engineers' Transit, having
SIZES respectively four, four and one-half, and
AND WEIGHTS. five-inch needles ; the average weight of each size, with plain telescope, is as follows :

4-inch needle, about.....	12½ lbs
4½-inch needle, about..	14 lbs
5-inch needle, about.....	16 lbs.

The tripod furnished with this Transit weighs between nine and ten pounds.

ENGINEERS' TRANSIT WITH SOLAR ATTACHMENT.

The engraving on page 28 represents our Engineers' Transit with five-inch needle and attachments of vertical arc of three inches radius, graduated on silver and reading to thirty seconds, level on telescope, clamp and tangent to telescope axis, and Solar apparatus with declination arc reading to thirty seconds.

The horizontal limb is graduated on sterling silver, and reads to single minutes.

The compass-circle is also made movable with rack and pinion, for setting off the variation of the needle.

This variation arc is applied to Engineers' Transits of our make, at an extra cost of \$4.00 if requested when ordering the instrument.

Where the variation arc is desired with the addition of the new Solar Attachment to any Engineers' Transit sent to us for the purpose, a charge of \$15.00 will be made.

No. 17.

ENGINEERS' TRANSIT, WITH SOLAR ATTACHMENT.

Price as shown, \$250.00.

EXPLORERS' TRANSIT.

No. 20.

Price, \$165.00

See page 257 of the Manual. Send for descriptive circular.

The Transit in its box and the tripod with the jointed legs in its case can be packed and carried in an ordinary 24-inch dress-suit case, as shown.

If desired, we can furnish a good leather dress-suit case for \$8.00 extra.

LIGHT MOUNTAIN TRANSIT.

THIS instrument, shown on page 30, is a modification of the Engineers' Transit, designed for mountain and mine surveys, but applicable as well to all other work of the engineer. It is exceedingly light and portable, its needle is four inches long, and its telescope is eight inches long with a power of twenty diameters.

The Sockets are like those shown on page 15 ; the compass-circle is movable about its center, so as to set off the variation of the needle.

As in our other Transits, the limb is graduated on sterling silver, reading usually to single minutes ; but, if desired, it can be graduated to read to twenty or thirty seconds.

There are caps above the leveling-screws to exclude dust, as in our other instruments.

The cut shows the celluloid reflectors, which are placed over the two opposite verniers of the limb, and are of special value in the surveys of mines, to throw light upon the graduations below.

Like the Engineers' Transit, the Mountain Transit is sometimes used with a plain telescope ; but oftener with one or more extras, as level, clamp and tangent and vertical arc, as shown.

Frequently, however, the Mountain Transit is furnished as shown on page 31, with vertical arc, level, clamp and tangent, and the Solar Attachment.

The Light Mountain Transit is almost always used upon our improved extension tripod (see page 179), the legs

No. 28.

Light Mountain Transit, two verniers to limb, 4-inch needle, with vertical arc, level on telescope, and clamp and tangent to telescope axis, and extension tripod.
Price, \$186.00.

**No. 30.**

Light Mountain Transit, two verniers to limb, 4-inch needle, with solar attachment, vertical arc reading to 1 minute, level on telescope, and clamp and tangent to telescope axis, and extension tripod. Price, \$245.00.

of which can be lengthened or shortened at will. It is thus adapted for use in mountain surveys, where one or more legs must be shortened ; or for mines, where in many places a short tripod is indispensable.

If desired, the sliding pieces can be easily turned end for end, the points being thus put out of the way and the tripod more easily transported. The tripod when closed is only three feet long, and is carried by a shawl strap, which we furnish with it.

The Light Mountain Transit, introduced by us in 1876 to meet a demand for a light instrument of the finest quality, has met with a very large sale, and has been universally approved.

While it is a Transit of first quality, adapted to all kinds of work which may be required, it is especially fitted for mining or mountain surveying where great portability is desired.

Besides the light mahogany box, in which the instrument is packed as usual, there is also supplied a light sole-leather case, furnished with shoulder-straps.

LEATHER CASE.

The weight of this instrument with plain telescope and without tripod is ten pounds ; with Solar Attachment, arc,

WEIGHT. level and clamp, as shown in the cut, twelve pounds. The extension tripod weighs about eight and one-half pounds.

THE SURVEYORS' TRANSIT.

(WITH TWO VERNIERS TO THE HORIZONTAL LIMB.)

THE Surveyors' Transit *with two verniers to limb* has essentially the same construction as the Engineers' Transit, but its compass-circle is movable about its center, like that of the Mountain Transit, in order that the variation of the needle may be set off in the surveys of old lines, or in running lines by the true meridian.

The arrangement of the sockets and leveling-head, however, permits the Surveyors' Transit to be detached from the leveling-head and replaced upon its spindle, when desired, without in any way disturbing its adjustments.

The sectional view, page 35, shows the interior construction of the sockets of the Transit, the manner in which it is detached from its spindle, and the means by which it can be taken apart if desired.

In the figure, the limb, B, is attached to the main socket, C, which is itself carefully fitted to the conical spindle, H, and held in place by the spring-catch, S.

The upper plate, A, carrying the compass-circle, standards, etc., is fastened to the flanges of the socket, K, which is fitted to the upper conical surface of the main socket, C; the weight of all the parts being supported on the small bearings of the end of the socket, as shown, so as to turn with the least possible friction.

A small conical center, in which a strong screw is inserted from below, is brought down firmly upon the upper end of the main socket, C, thus holding the two

No. 47.

Surveyors' Transit, two verniers to limb, 5-inch needle, with $4\frac{1}{2}$ -inch vertical circle and vernier to 1 minute, level on telescope, clamp and tangent to telescope axis, and tripod. Price, \$160.00.

plates of the instrument securely together, and at the same time allowing them to move freely around each other in use.

A disk above the conical center contains the steel center-pin upon which rests the needle, as shown; the disk is fastened to the upper plate by two screws.

The clamp to limb, with clamp-screw, is also shown at D F, attached to the main socket below.

The main socket with all its parts is of the best bell-metal, and is most carefully and thoroughly made, the long bearing of the sockets insuring their firm and easy movement, while at the same time they are entirely out of reach of dust, or other source of wear.

When desired, the whole upper part of the instrument may be taken off from the spindle by pulling out the head

THE SOCKETS AND CIRCULAR PLATES.

of the spring-catch at S, and when replaced will be secured by the self-acting spring of the catch.

The figure also shows the covers of the leveling-screws, the shifting center of the lower leveling-plate, and the screw and loop for the attachment of the plummet

TO TAKE APART THE SURVEYORS' TRANSIT.

When it is necessary to separate the plates of the Transit, proceed as follows (see page 35):

(1) Remove the clamp-screw of the variation arc and take off the head of the pinion, both outside the compass-circle. (2) Unscrew the bezel-ring holding the glass cover of the compass, remove the needle and button beneath it, and take out the two screws, so as to remove the disk. (3) Take the instrument from its spindle, and with a screw-driver take out the screw from the under side of the conical center. (4) Drive out the center from below by a round piece of wood, holding the instrument so that the center will not bruise the circle. (5) Set the instrument again upon its spindle, unscrew the milled head cap from the thimble containing the opposing spring of the tangent movement to limb, take out the three screws which fasten that movement to the upper plate, and the plates can then be separated. To put the Transit together again, proceed exactly the reverse of the operation thus described.

SIZES AND WEIGHTS. The sizes and weights of the Surveyors' Transits with plain telescope, and having two verniers to limb are :

4-in. needle, with leveling-head, but no tripod, about	13 $\frac{3}{4}$ lbs
5-in. needle, " " " " " "	16 $\frac{1}{2}$ lbs.
5 $\frac{1}{2}$ -in. needle, " " " " " "	17 $\frac{1}{2}$ lbs.

THE SURVEYORS' TRANSIT.

(WITH ONE VERNIER TO THE HORIZONTAL LIMB.)

THE Surveyors' Transit *with one vernier to limb* is a modification of the instrument just described, in which there is but one double vernier to limb and a different arrangement of the sockets, as shown in the sectional cut on page 39.

The instrument is more compact and somewhat lighter than that with two verniers, and is furnished at less cost. Its graduations, telescope and attachments are all equal to those of the best Transits ; and after an experience of more than thirty years the instrument has proved itself in every way satisfactory for all classes of work

This instrument may be taken apart by first removing the pinion head and clamp-screw near the compass-circle, then unscrewing the bezel-ring, taking out the needle and button underneath, and next removing the disk in which the center-pin is fixed, by taking out two small screws which confine it. The four screws which hold the washer to the under plate must then be removed, the milled head cap of the tangent opposing spring be unscrewed, and the three screws which secure the tangent support to the upper plate removed ; and then the plates can be separated. The several parts are replaced in the reverse order.

The adjustments and use of this instrument are like those of the others already described, and its attachments to the telescope the same, if desired.

It is represented in the cut with a level on telescope and clamp and tangent to telescope axis. (See page 38.)

No. 76.

Surveyors' Transit, one vernier to limb, 5-inch needle, with level on telescope, clamp and tangent to telescope axis, and tripod.
Price, \$133.00.

The sectional cut shows the arrangement of the sockets **THE** of this instrument. The spindle, C, is fitted **SOCKETS.** to the socket of the leveling-head, as shown, and connected therewith by a screw and washer underneath, as in the figure.

The socket, K, is formed in the metal of the upper plate, a strong washer with four screws, only two of which are seen in the cut, keeping the two plates together, but at the same time allowing them to turn freely around each other.

The clamp to limb, with clamp-screw, is shown in dotted lines at D F, under the plates.

The vernier with the opening above is shown on the left at A. The arrangement of the center-pin, needle, etc., is like that of the Transit with two verniers, but the instrument remains attached to the leveling-head like the Engineers' Transit.

THE SOCKETS AND CIRCULAR PLATES.

SIZES AND WEIGHTS. The sizes and weights of the Surveyors' Transit with plain telescope, and having one vernier to limb are :

4-in. needle, with leveling-head, but no tripod, about	13 lbs.
5-in. needle, " " " " " "	16 lbs.
5½-in. needle, " " " " " "	17 lbs.

SURVEYORS' TRANSIT WITH SOLAR ATTACHMENT.

The engraving on page 41 represents our Surveyors' Transit with five-inch needle, to which is adapted the Solar Attachment with vertical arc, level on telescope, and clamp and tangent to axis of telescope ; both the vertical arc and the arc of the declination arm being graduated on silver and reading by vernier to thirty seconds.

The instrument is furnished with two verniers to limb or with one vernier to limb, as may be desired ; both patterns have shifting center to the leveling-head.

60 AND 90.

SURVEYORS' TRANSIT WITH SOLAR ATTACHMENT.

THE RECONNOISSANCE TRANSIT.

IN RESPONSE to a demand for a very light Transit for rapid work, where extreme accuracy is not required, we have introduced the Reconnaissance Transit, shown on page 43.

It has a needle three and one-half inches in length, a limb five inches in diameter, graduated on sterling silver, reading by one double vernier to single minutes, and is provided with a spring tangent movement like the larger instruments.

The limb is figured from 0 to 180 unless otherwise ordered.

The telescope is nine inches long and has a power of from eighteen to twenty diameters, and is furnished with stadia wires for measuring distances; it has also a long level, vertical circle reading to five minutes, and clamp and tangent to axis. The object-glass is focused by a rack and pinion and the eyepiece by a spiral movement.

The compass-circle is arranged to set off the variation of the needle, the movement being made by a pinion.

The instrument has also, as shown, a leveling-head with shifting center, and with spring clamp and tangent, and it is set upon our light extension tripod, the legs of which close up to about three feet in length.

This instrument is finished with the same care as our larger and more expensive Transits, and we recommend it as a thoroughly well made and reliable instrument for a large variety of work. The quality of the instrument, together with its portability, have already made it very popular.

The weight of this Transit without the tripod is about seven and three-quarter pounds, complete with tripod about fifteen pounds.

THE BUILDERS' TRANSIT.

THE Builders' Transit, see page 45, is an instrument devised for use in the construction of buildings where it is necessary not only to furnish levels, but to determine points in a vertical plane above or below the level line, or on either side and in line with the center of the instrument, more conveniently than can be done with the Architects' Level. The instrument has a telescope with long graduated level, clamp and tangent to axis, a graduated limb reading by an index to one degree, clamp and tangent to both limb and leveling-head, a shifting center, plain tripod and trivet-plate.

In use, the instrument is set up either upon the tripod or trivet, and the plates are accurately leveled by the two levels shown.

If it is desired to run a level line, the bubble of the telescope level is brought into the middle by the clamp and tangent of the axis, in which position the
LEVEL LINE. horizontal wire of the telescope will determine a level line, as in the telescope of the ordinary Level, and any horizontal angle to one degree may be read off upon the limb. The limb is figured from 0 to 180 each way.

When necessary to obtain points in a vertical plane, either above or below a given point, the
VERTICAL LINE. plates should be clamped and the clamp of the telescope axis released, when the telescope may be directed either above or below to the point desired.

To determine two points in a straight line with the instrument and on opposite sides of its
STRAIGHT LINE. center, direct the telescope to one of the points, then clamp the plates, and the other point may be obtained by reversing the telescope upon its axis.

The weight of the Builders' Transit is about seven pounds; and with the tripod complete about thirteen pounds.

No. 105.

Builders' Transit, with level on telescope, clamp and tangent to telescope axis, limb and spindle, and with leveling-screws and tripod, as shown.
Price, \$80.00.

THE VERNIER TRANSIT-COMPASS.

THIS instrument, shown on page 47, is essentially a Vernier Compass with a telescope in place of the ordinary sight-vanes, thus giving the surveyor the means of taking long sights, either on a level or on hilly ground, with ease and accuracy.

The telescope can also be supplied with attachments, as shown, and levels and angles of elevation and depression taken, as with the more expensive instruments.

The telescope is eleven inches long and of fine quality.

The compass-circle is moved about its center by a pinion placed underneath the circular plate, and the variation of the needle is set off to single minutes upon a graduated arc attached to the plate, as shown in the cut. There is also a clamp-screw by which the circle is made secure.

The figure represents the instrument with six-inch needle; in the smaller size the vernier of the compass-circle is within the box and under the glass, as in the Surveyors' Transit.

The needle-lifting screw is also underneath the plate, but is not shown in the cut.

The clamp-screw, by which the instrument is fixed to the spindle, and the spring-catch which secures it, are both shown on opposite sides of the socket.

The levels are both above the plate, and are made adjustable by capstan-head nuts at either end.

This instrument is commonly used on a ball-spindle placed in a compass tripod, as shown on page 47, but it is sometimes fitted to a leveling-head like that shown on page 123.

SIZES AND WEIGHTS. We make two sizes of this instrument, having respectively five and six-inch needles, the average weights of which are as follows :

5-inch needle, plain telescope, and without tripod, 9 lbs.
 6-inch needle, “ “ “ “ “ 11 $\frac{3}{4}$ lbs.

No. 117.

Vernier Transit, 6-inch needle, with 3 $\frac{1}{2}$ -inch vertical circle and vernier reading to 5 minutes, level on telescope, clamp and tangent to telescope axis, and tripod.
 Price, \$101.00.

ATTACHMENTS FOR TRANSITS.

IN THE use of the Transit it is generally found advisable to add one or more attachments to the telescope. All our Transits and their attachments are now made to standard sizes, so that one or more of these useful appliances can be fitted to the instrument at any time without additional expense other than the cost of the attachment itself.

When any of these attachments are desired, either for our instruments or those of other makers, it is best to send the instrument to us; in some cases they can be applied by a skilful mechanic nearer the customer, but this is generally more expensive and less satisfactory.

The principal attachments for the Transit are :

VERTICAL CIRCLE (see pages 49-51).

VERTICAL ARC (see page 52).

LEVEL ON TELESCOPE (see page 53).

CLAMP AND TANGENT to Telescope Axis (see pages 53 and 55).

SIGHTS ON TELESCOPE (see page 55).

SIGHTS ON STANDARDS for Right Angle Observation (see page 55).

ATTACHED MAGNIFIERS to Horizontal Limb (see page 55).

GRADIENTER, combined with Clamp and Tangent (see page 56).

DETACHABLE TELESCOPES for Vertical Sighting (see page 58).

REFLECTOR for Illuminating the Cross-Wires (see page 59).

DIAGONAL PRISM for Eyepiece of Telescope (see page 59).

PLUMMET-LAMP (see page 60).

SOLAR ATTACHMENT to Telescope (see pages 61-69).

SOLAR SCREEN (see page 80).

THE VERTICAL CIRCLE.

No. 136.

The Vertical Circle has its graduations on sterling silver and is figured from 0 to 90 ; three sizes are most commonly used, the three and one-half-inch circle reading by vernier to five minutes, as shown in Fig. 117, the four and one-half-inch circle reading by vernier to single minutes, as shown in Fig. 136, and the five-inch circle reading by vernier to single minutes.

To adjust the Vertical Circle : Having the instrument firmly set up and carefully leveled, bring into line the zeros of the circle and vernier, and with the telescope find some well-defined point, from one hundred to five hundred feet distant, which is cut by the horizontal wire. Turn the instrument half-way around, transit the telescope, and fixing the wire upon the same point as before, observe if the zeros are again in line. If not, loosen the capstan-head screws which fasten the

ADJUSTMENT.

vernier, and move the zero of the vernier over half the error ; bring the zeros again into coincidence, and proceed exactly as before, until the error is entirely corrected, when the adjustment will be complete. In almost all cases the error is slight, and may be most readily removed by putting the zeros in line and then moving the horizontal wire by the vertical capstan-head screws over half the interval.

No. 138.

VERTICAL CIRCLE WITH OPPOSITE VERNIERS.

We also make a modification of the five-inch circle, shown in Fig. 138, enclosed in outside shield, fastened to which are two opposite verniers reading to single minutes, the arm projecting from the lower side being actuated by a capstan-head screw, as shown in the cut, to bring the zeros of the verniers into exact adjustment in relation to the level.

The price of Vertical Circle, No. 138, is \$35.00.

PRICES OF VERTICAL CIRCLES.

No. 141.

ALUMINUM GUARD FOR VERTICAL CIRCLE.

The engraving shown above illustrates an aluminum guard as applied to the vertical circle to protect the graduations from injury. The extra cost for this attachment is \$6.00.

THE VERTICAL ARC.

NOS. 139 AND 140.

The Vertical Arc is made in two sizes, two and one-half and three inches radius, graduated on sterling silver and read by a vernier swung from the axis and movable by a tangent screw.

The arc is movable around its bearing on the axis, can be readily clamped at 0 with the vernier in any position of the telescope, and any degree of elevation can be read off directly on the arc.

The arc of two and one-half inches radius is generally used on the Light Mountain Transit, and reads by its vernier to single minutes, while the arc of three inches radius is commonly used on the larger Transits, and is read by the vernier to thirty seconds. The Vertical Arc can be readily added to any Transit of our manufacture.

Price of the Vertical Arc, either size..... \$18.00

THE LEVEL ON TELESCOPE, AND CLAMP AND TANGENT TO TELESCOPE AXIS.

NOS. 145 AND 148.

The Level on Telescope, No. 145, consists of a brass tube about six and one-half inches long, each end of which is held between two capstan nuts connected with a screw or stem attached to the under side of the telescope tube.

The vial enclosed in the tube is a little over five inches long and half an inch in diameter, is ground on its interior surface so as to insure an even and sensitive bubble, the length of which is measured by the scale above; the scale is graduated into tenths of an inch, and is figured from 0 at the middle to 5, 10, 15, 20 on either side, and thus determines when the bubble is brought into the middle of its run.

Price of Level on Telescope \$12.00

To adjust the Level on Telescope: When the vernier of the vertical circle is adjusted as per page 49, and is at zero, the line of collimation is level and the bubble may be brought into the

ADJUSTMENT.

middle of its run by the capstan-head nuts. Another method: First level the instrument carefully, and with the clamp and tangent movement to the axis make the telescope horizontal, as near as may be, by the eye; then, having the line of collimation previously adjusted, drive a stake at a convenient distance, say from one hundred to three hundred feet, and note the height cut by the horizontal wire upon a staff set at the top of the stake.

Fix another stake in the opposite direction and at the same distance from the instrument, and without disturbing the telescope turn the instrument upon its spindle, set the staff upon the stake, and drive the stake into the ground until the same height is indicated as in the first observation.

The top of the two stakes will then be in the same horizontal line, however much the telescope may be out of level.

Now remove the instrument from fifty to one hundred feet to one side of either of the stakes and in line with both; again level the instrument, clamp the telescope as nearly horizontal as may be, and note the heights indicated upon the staff placed first upon the nearest and then upon the most distant stake. If both agree, the telescope is level; if they do not agree, then with the tangent screw move the wire over nearly the whole error, as shown at the distant stake, and repeat the operation just described. Proceed thus until the horizontal wire will indicate the same height at both stakes, when the telescope will be truly horizontal. Taking care not to disturb the position of the telescope, bring the bubble into the middle by the little leveling-nuts at the end of the tube, when the adjustment will be complete.

THE CLAMP AND TANGENT.

The Clamp and Tangent, No. 148, consists of an arm at one end encircling the telescope axis, and at the other end connected with the tangent screw; the clamp is fastened at will to the axis by a clamp-screw inserted at one side of the ring, and then by turning the tangent screw the telescope is raised or lowered as desired.

The clamp and tangent must always accompany the vertical circle and level on telescope, whenever either is added to a Transit. Price, \$6.00.

SIGHTS ON TELESCOPE AND ON STANDARDS.

For convenience of observation we occasionally place a pair of small sights on the telescopes of our Transits. These sights have folding joints, so that they may lie close to the telescope when not in use. Sights are also placed on the standards at an angle of ninety degrees with the telescope, for use in offsetting.

Price of either style, per pair.....\$8.00

Attached Magnifiers are frequently used over the verniers of the horizontal or vertical arc, and are held by a universal three-jointed arm which allows
MAGNIFIERS. the lens to be placed at will over any point of the vernier. Price, each, \$5.00.

GRADIENTER.

GRADIENTER ATTACHMENT. Price, \$18.00.

This attachment, as shown, is often used with the Transit for determining distances, fixing grades, and similar work.

It consists mainly of a screw attached to the expanded arm of the ordinary clamp of the telescope axis ; the screw is accurately cut, and passing through a nut in one side of the arm, presses against a little stud, A, fixed to the inside surface of the right-hand standard. In the side of the arm opposite the screw is an enclosed spiral spring which presses against the side of the stud, thus securing a positive movement of the gradienter-screw.

Near the other end of the screw, and turning with it, is a wheel or micrometer, the rim of which is covered with sterling silver, and graduated into one hundred equal parts.

A small silver scale, attached to the arm and just above the micrometer wheel, is graduated into spaces, each of which is just equal to one revolution of the screw ; so that by comparing the edge of the wheel with the graduations of the scale, the number of complete revolutions of the screw can be easily counted.

When the clamp is made fast to the axis, the gradienter-screw will act like an ordinary tangent screw to incline the **MEASURING** telescope. And as the value of its screw **DISTANCES.** thread is such that a complete revolution of the screw will move the horizontal cross-wire of the telescope over a space of one foot on a vertical rod at a distance of one hundred feet, it is clear that when the screw is turned through fifty spaces on the graduated head, the wire will pass over fifty hundredths, or one-half a foot on the rod, and so on in the same proportion. In this way the gradienter can be used in the measurement of distances.

To avoid any possibility of error, it is advisable that observations should not be taken by a reversal of the screw.

Grades can also be established with great facility, as follows : Level the instrument; bring the telescope level-bubble to the middle by the clamp and gradienter-screw ; move the graduated head until its zero is brought to **GRADES.** the edge of the scale ; then turn off as many spaces on the head as there are hundredths of feet to the hundred in the grade to be established.

DETACHABLE TELESCOPES FOR VERTICAL SIGHTING.

A common arrangement for sighting up or down a vertical shaft is shown in No. 160, in which an extra telescope is fitted by a flange and disk connecting it with the axis, so as to make it precisely parallel to the main telescope; a counterpoise, as shown, is fitted to the other end, and both can be detached at pleasure, and placed in the Transit box when not in use.

No. 160.

No. 161.

In No. 161, the extra telescope is connected with the main telescope by coupling-nuts, which fasten it securely directly over the center of the instrument and allow its ready removal and replacement without disturbing its adjustments. It will be understood that in both arrangements the

extra telescope is adjusted to the main telescope of the Transit so that the lines of collimation of both are parallel and in the same plane, horizontal in No. 160 and vertical in No. 161 ; and in both the extra telescope swings over the outside of the Transit plates. The diagonal prism is often used with the extra telescope for greater convenience in sighting. -

Price of either Telescope, No. 160 or 161.....\$25.00.

NOS. 165 AND 166.
REFLECTOR.
PRICES \$4.00 AND \$5.00.

The Reflector, Nos. 165 and 166, is an elliptical piece of silver, inclined at an angle of forty-five degrees with its ring, which is fitted to the object-glass end of the telescope. The opening in the Reflector allows the use of the telescope, while a light held near the inner surface illuminates the cross-wires. (See page 261).

The Diagonal Prism, No. 168, is used when greater vertical angles are to be taken than are possible with the ordinary telescope. It consists of a prism attached to the cap of the eyepiece, by which the object is presented to the eye when placed at right angles with the telescope. When the telescope is directed to the sun the slide or darkener containing colored glass is moved over the opening.

No. 168.
DIAGONAL PRISM.
PRICE, \$8.00.

The circular plate with which the prism is connected is made to turn in the cap, so that, when it is substituted for the ordinary cap of the eyepiece, the opening of the prism can be easily adjusted to the position of the eye. Observations can be taken with the prism up to an angle of sixty degrees elevation.

**No. 170.****PLUMMET-LAMP**

The Plummet-Lamp, No. 170, is a large plummet, of which the upper part is hollow to contain oil; it has also a tube for a wick, and an extinguisher.

It is hung in gimbals by a chain with hook, and so always assumes a vertical position, and when suspended from the shifting center of a leveling-head it can be easily adjusted over a given point.

Two of these lamps are often packed in a simple wooden case, furnished with a strap to sling over the shoulders. The weight of each lamp is about one and one-quarter pounds, and the price of each as shown is \$10.00.

SOLAR ATTACHMENT.

No. 190.

THE Solar Attachment is essentially the solar apparatus of Burt placed upon the cross-bar of the ordinary Transit. A disk one and one-half inches in diameter, having a short round pivot projecting above its upper surface, is first securely screwed to the telescope axis. Upon this pivot rests the enlarged base of the polar axis, which is also firmly connected with the disk

by four capstan-head screws passing from the under side of the disk into the base already named. These screws serve to adjust the polar axis, as will be explained hereafter.

The Hour-Circle surrounding the base of the polar axis is easily movable about it, and can be fastened at any

point desired by two flat head screws
point desired by two flat head screws
above. It is graduated to five minutes of time, is figured from I to XII, and is read by an index fixed to the declination arc and moving with it. A hollow cone, or socket, fitting the polar axis and made to move upon it, or to be clamped at any point desired by a milled head screw on top, furnishes by its arms below a firm support for the declination arc, which is securely fastened to it.

The Declination Arc has a radius of about five inches, and is graduated to quarter degrees. On the Mountain Transit

DECLINATION it reads by its vernier to single minutes of
ARC. arc, and on the larger Transits to half minutes of arc, the graduations of both vernier and limb being in the same plane. The declination arc has the usual lenses and silver plate on the two opposite blocks, also a clamp and tangent movement, as shown in the cut. The arc of the declination limb is turned on its axis and one or the other solar lens used, as the sun is north or south of the equator; the cut shows its position when the sun is north.

The Latitude is set off by means of a large vertical limb figured from the center each way in two rows,

LATITUDE from 0 to 80° and from 90° to 10°, the first
ARC. series being intended for reading vertical angles and the latter series for setting off the latitude. The vernier of the vertical limb is made movable by the tangent screw attached, so that its zero and that of the

limb are readily made to coincide when, in adjusting the limb to the level of the telescope, the arc is clamped to the axis.

The usual tangent movement to the telescope axis serves to incline the telescope to the proper angle, as hereafter described. A level on the under side of the telescope, with ground vial and scale, is indispensable in the use of the solar attachment. The arcs, verniers and hour-circle are all graduated on silver. Price of the Solar Attachment, \$60.

NOTE.—See pages 89–94 for definitions of astronomical terms.

EXPLANATION OF THE SOLAR ATTACHMENT.

In the engraving on page 64 we have a graphic illustration of the solar apparatus, the circles shown being intended to represent those supposed to be drawn upon the concave surface of the heavens.

When the telescope is set horizontal by its spirit-level, the hour-circle will be in the plane of the horizon, the polar axis will point to the zenith, and the zeros of the vertical arc and its vernier will coincide. Now, if we incline the telescope, directed north as shown in the cut, the polar axis will descend from the direction of the zenith. The angle through which it moves, being laid off on the vertical arc, will be the co-latitude of the place where the instrument is supposed to be used, the latitude itself being found by subtracting this number from ninety degrees.

When the sun passes above or below the equator, its declination, or angular distance from it, as given in the Ephemeris, can be set off upon the declination arc, and its image brought into position as before.

In order to do this, however, it is necessary not only that the latitude and declination be correctly set off upon

GRAPHIC ILLUSTRATION OF THE SOLAR APPARATUS.

their respective arcs, but also that the instrument be moved in azimuth until the polar axis points to the pole of the heavens, or, in other words, is placed in the plane of the meridian; and thus the position of the sun's image will indicate not only the latitude of the place, the declination of the sun for the given hour and the apparent time, but it will also determine the meridian, or true north and south line passing through the place where the observation is made.

The interval between two equatorial lines, $c c$, as well as between the hour lines, $b b$, is just sufficient to include the circular image of the sun, as formed by the solar lens on the opposite end of the revolving arm.

Allowance for Declination : Let us now suppose the observation made when the sun has passed the equinoctial point, and when its position is affected by declination

DECLINATION.

By referring to the Ephemeris, and setting off on the arc the declination for the given day and hour, we are still able to determine its position with the same certainty as if it remained on the equator.

When the sun's declination is south, that is, from the 22d of September to the 20th of March in each year, the arc is turned downward, or *toward* the plates of the Transit, while during the remainder of the year the arc is turned *from* the plates.

When the Solar Attachment is accurately adjusted and the transit plates made perfectly horizontal, the latitude of the place and the declination of the sun for the given day and hour being also set off on their respective arcs, and the instrument set approximately north by the magnetic needle, *the image of the sun cannot be brought between the equatorial lines until the polar axis is placed in the plane of the meridian*

of the place, or in a position parallel with the axis of the earth. The slightest deviation from this position will cause the image to pass above or below the lines, and thus discover the error.

From the position of the sun in the solar system we thus obtain a direction absolutely unchangeable, from which to run lines and measure horizontal angles.

This simple principle is not only the basis of the construction of solar instruments, but it is the only cause of their superiority over instruments having the ordinary magnetic needle. For in an instrument having a magnetic needle, the accuracy of the horizontal angles indicated, and therefore of all the observations made, depends upon the delicacy of the needle and the constancy with which it assumes a certain direction, called the magnetic meridian.

The principal causes of error in the needle, briefly stated, are the dulling of the pivot and the resulting injury to the jeweled-center, the loss of polarity in the **ERROR IN NEEDLE.** needle, the influence of local attraction, and the effect of the sun's rays producing the diurnal variation. From all these imperfections the solar instrument is free.

The latitude of the place and the declination of the sun being set off upon the respective arcs, we are able not only to run the true meridian, or a due east and west course, but also to set off horizontal angles with minuteness and accuracy from a direction which never changes and which is unaffected by attraction of any kind.

ADVANTAGES OF THE SOLAR ATTACHMENT.

From what has been already said, the intelligent surveyor will readily understand that the more perfect horizon obtained by the use of the telescope level, and the use of a

telescope in place of sights, render the attachment more accurate than the ordinary Solar Compass.

The attachment can be added to the telescope of any good Transit at a comparatively small cost, thus enabling the surveyor to establish the true meridian, to determine the correct latitude, and to obtain true time very nearly.

Its adaptation to the purposes of illustration and instruction in practical astronomy in colleges and schools will occur to every teacher; and it furnishes for the Government Surveyor a long-sought and much-needed instrument, superior to the Solar Compass formerly used.

In experiments made by us, an error of one-quarter of a minute in the direction of the true meridian, or in latitude, could be easily detected by observing the sun's image by a magnifier; and we feel confident that any one who uses the Solar Attachment will be surprised and delighted with its work. When not in use it should be removed from the telescope and packed in the instrument case, and the thin sheath put on the polar axis and kept in its place by the screw and washer of the socket.

The weight of the Solar Attachment is but little more than ten ounces, and is so distributed as not to disturb the counterpoise of the instrument, thus obviating the objection which has hitherto prevented the successful use of the telescope with the solar apparatus.

It is evident that all Transits to which the Solar Attachment is to be applied should have a horizontal limb and verniers, and should be furnished with a level on telescope, clamp and tangent to telescope axis, and vertical arc and vernier. They should also have a movable compass-circle to set off the variation of the needle, and be leveled by leveling-screws.

It will be understood that Transits of any kind which are to be fitted with the Solar Attachment must be in perfect order, especially in respect to the sockets, before correct work can be done.

TO RUN LINES WITH THE SOLAR ATTACHMENT.

Having set off the latitude of the place on the vertical arc, and the declination, corrected for refraction, for the given day and hour as computed from the tables in the Solar Ephemeris, the instrument being also carefully leveled by the telescope bubble, set the horizontal limb at zero and clamp the plates, loosen the lower screw, so that the Transit moves easily upon its lower socket, set the instrument approximately north and south, with the object-glass end of the telescope towards the north, turn the proper solar lens to the sun, and, with one hand on the plates and the other on the revolving arm, move them from side to side until the sun's image is brought between the equatorial lines on the silver plate.

The lower clamp of the instrument should now be fastened, and any further lateral movement be made by the tangent screw of the leveling-head. The telescope will now be in the true meridian, and may be used like the sights of the ordinary Solar Compass, but with far greater accuracy and satisfaction in establishing meridian lines. When the upper or vernier plate is unclamped from the limb, an angle read by the verniers is an angle from the meridian; and thus parallels of latitude or any other angles from the true meridian may be established, as with the Solar Compass.

The bearing of the needle, when the telescope is on the meridian, will also give the variation of the needle at the point of observation.

If the instrument, as in our Surveyors' Transits, has a movable compass-circle, the variation of the needle can be set off to single minutes, the needle kept at zero, or "with the sun," and thus lines be run by the needle alone when the sun is obscured.

REFRACTION IN DECLINATION.

The Table of Refractions on pages 70-74 is calculated for latitudes between $2\frac{1}{2}^{\circ}$ and 70° at intervals of $2\frac{1}{2}^{\circ}$, that being as near as is required.

The declination ranges from 0° to 20° both north and south, the + declinations being north and the - south, and is given for every 5° , that being sufficiently near for all practical purposes. The hour angle in the first column indicates the distance of the sun from the meridian in hours, the refraction given for 0 hours being that which affects the observed declination of the sun when on the meridian, commonly known as meridional refraction; the refraction for the hour just before or after noon is so nearly that of the meridian that it may be called and allowed as the same.

When the table is used, it must be borne in mind that when the declination is north, or + in the table, the refraction is to be added; when the declination is south, or -, the refraction must be subtracted. It will be noticed that the refraction in south, or -, declination increases very rapidly as the sun nears the horizon, showing that observations should not be taken with the sun when it is south of the equator, less than one hour from the horizon.

A TABLE OF MEAN REFRACTIONS IN
DECLINATION.

To apply on the declination arc of Solar Attachment of either Compasses or Transits.

Computed by EDWARD W. ARMS, C. E., for W. & L. E. GURLEY, Troy, N. Y.

TO COMPUTE THE DECLINATION.

Suppose the corrected declination is desired for the different hours of February 15, 1905, at Troy, N Y. The latitude is $42^{\circ} 44'$. The longitude is practically five hours ; so that the declination given in the Ephemeris for apparent noon of that day at Greenwich would be that for 7 A. M. at Troy, or five hours earlier. Note carefully the algebraic signs. The declination is South or minus. Its hourly difference is plus. The refraction always is plus. Hence we use the algebraic sum, thus :—

$S12^{\circ} 47' 57''.5$ is the tabular declination for 7 A. M.

$51'' 3$ Sub hr. dif

$$-12^{\circ} 47' 6'' 2 + \text{ref (4 hrs) } 3' 21'' = -12^{\circ} 43' 45'', \text{ 8 A. M}$$

$51'' 3$

$$-12^{\circ} 46' 14''.9 + \text{ref (3 hrs.) } 2' 02'' = -12^{\circ} 44' 13'', \text{ 9 A. M.}$$

$51'' 3$

$$-12^{\circ} 45' 23''.6 + \text{ref (2 hrs.) } 1' 35'' = -12^{\circ} 43' 49'', \text{ 10 A. M.}$$

$51'' 3$

$$-12^{\circ} 44' 32''.3 + \text{ref. (1 hr.) } 1' 20'' = -12^{\circ} 43' 12'', \text{ 11 A. M.}$$

$51'' 3$

$$-12^{\circ} 43' 41''.0 + \text{ref. (0 hr.) } 1' 20'' = -12^{\circ} 42' 21'', \text{ 12 M.}$$

$51''.3$

$$-12^{\circ} 42' 49''.7 + \text{ref (1 hr) } 1' 20'' = -12^{\circ} 41' 30'', \text{ 1 P. M.}$$

$51''.3$

$$-12^{\circ} 41' 58''.4 + \text{ref. (2 hrs) } 1' 35'' = -12^{\circ} 40' 23'', \text{ 2 P. M.}$$

$51''.3$

$$-12^{\circ} 41' 07''.1 + \text{ref (3 hrs.) } 2' 02'' = -12^{\circ} 39' 05'', \text{ 3 P. M.}$$

$51''.3$

$$-12^{\circ} 40' 15''.8 + \text{ref. (4 hrs) } 3' 21'' = -12^{\circ} 36' 55'', \text{ 4 P. M.}$$

Again, suppose the corrected declination is desired for the different hours of May 15, 1905, at Troy. Now the declination is North or plus and the hourly difference is plus.

$$\begin{array}{rcl} \text{N } 18^{\circ} 46' 14''.9 & + \text{ ref (5 hrs) } 1' 24'' & = 18^{\circ} 47' 39'', \text{ 7 A. M} \\ & 35'' 7 \text{ Add hr dif.} & \end{array}$$

$$\begin{array}{rcl} \hline 18^{\circ} 46' 50''.6 & + \text{ ref (4 hrs) } 54'' & = 18^{\circ} 47' 45'', \text{ 8 A. M} \\ & 35''.7 & \end{array}$$

$$\begin{array}{rcl} \hline 18^{\circ} 47' 26''.3 & + \text{ ref. (3 hrs.) } 39'' & = 18^{\circ} 48' 05'', \text{ 9 A. M} \\ & 35'' 7 & \end{array}$$

$$\begin{array}{rcl} \hline 18^{\circ} 48' 02''.0 & + \text{ ref. (2 hrs.) } 30'' & = 18^{\circ} 48' 32'', \text{ 10 A. M} \\ & 35'' 7 & \end{array}$$

$$\begin{array}{rcl} \hline 18^{\circ} 48' 37''.7 & + \text{ ref (1 hr) } 26'' & = 18^{\circ} 49' 04'', \text{ 11 A. M} \\ & 35'' 7 & \end{array}$$

$$\begin{array}{rcl} \hline 18^{\circ} 49' 13''.4 & + \text{ ref. (0 hr) } 26'' & = 18^{\circ} 49' 39'', \text{ 12 M} \\ & 35'' 7 & \end{array}$$

$$\begin{array}{rcl} \hline 18^{\circ} 49' 49''.1 & + \text{ ref. (1 hr.) } 26'' & = 18^{\circ} 50' 15'', \text{ 1 P. M.} \\ & 35''.7 & \end{array}$$

$$\begin{array}{rcl} \hline 18^{\circ} 50' 24''.8 & + \text{ ref (2 hrs) } 30'' & = 18^{\circ} 50' 55'', \text{ 2 P. M} \\ & 35''.7 & \end{array}$$

$$\begin{array}{rcl} \hline 18^{\circ} 51' 00''.5 & + \text{ ref. (3 hrs.) } 39'' & = 18^{\circ} 51' 39'', \text{ 3 P. M.} \\ & 35'' 7 & \end{array}$$

$$\begin{array}{rcl} \hline 18^{\circ} 51' 36''.2 & + \text{ ref. (4 hrs.) } 54'' & = 18^{\circ} 52' 30'', \text{ 4 P. M.} \\ & 35'' 7 & \end{array}$$

$$\begin{array}{rcl} \hline 18^{\circ} 52' 11''.9 & + \text{ ref (5 hrs.) } 1' 24'' & = 18^{\circ} 53' 36'', \text{ 5 P. M.} \end{array}$$

We believe it will be found that the use of the table as illustrated above will not only relieve the surveyor of the perplexity hitherto attending the subject of refractions, but will also enable him to secure more accurate results than were possible by the methods usually given.

The calculation of the declination for the different hours of the day should, of course, be made and noted before the surveyor begins his work, that he may lay off the change from hour to hour, from a table prepared as before described.

TO FIND THE LATITUDE.

First, level the instrument very carefully, using, as before, the level of the telescope until the bubble will remain in the middle during a complete revolution of the instrument, the tangent movement of the telescope being used in connection with the leveling screws, and the axis of the telescope being firmly clamped.

Next, clamp the vertical arc, so that its zero and the zero of its vernier coincide as near as may be, and then bring them into exact line by the tangent screw of the vernier.

Then, having the declination of the sun for 12 o'clock of the given day as affected by the meridional refraction carefully set off upon the declination arc, note also the equation of time; and fifteen or twenty minutes before noon, the telescope being directed to the north and the object-glass end lowered until, by moving the instrument upon its spindle and the declination arc from side to side, the sun's image is brought nearly into position between the equatorial lines. Now bring the declination arc directly in line with the telescope, clamp the axis, and with the tangent screw of the telescope axis bring the image precisely between the lines, following the sun's motion as the image runs below the lower equatorial line, or, in other words, as long as the sun continues to rise in the heavens.

When the sun reaches the meridian the image will remain stationary in altitude for an instant, and will then begin to rise on the plate.

The moment the image ceases to run below is, of course, apparent noon, when the index of the hour arc should indicate XII., and the latitude be determined by the reading of the vertical arc.

The angle through which the polar axis has moved in the operation just described is measured from the zenith instead of the horizon, as in the Solar Compass, so that the angle read on the vertical limb is the complement of the latitude.

The latitude itself is readily found by subtracting this angle from 90° ; thus at Troy the reading of the limb being found as above directed to be $47^\circ 16'$, the latitude will be $90^\circ - 47^\circ 16' = 42^\circ 44'$. *The latitude may also be read direct by referring to the inner row of figures on the arc, beginning with 90 in the middle and reading to 10 on either side.

TIME FOR USING THE SOLAR.

The Solar, like the ordinary instrument, can be used at all seasons of the year, the most favorable time being, of course, in the summer, when the declination is north and the days are long and more generally fair. It is best not to take the sun at morning and evening when it is within half an hour of the horizon, nor at noon, for about the same interval before and after it passes the meridian.

ADVANTAGES OF THE SOLAR IN SURVEYING.

While the solar is indispensable in the surveys of public lands, it also possesses important advantages over the magnetic needle Compass when used in the ordinary surveys of

farms, and similar work. For not only can lines be run and angles be measured without regard to the diurnal variation or the effect of local attraction, but the bearings being taken from the true meridian will remain unchanged for all time.

In favorable weather surveys can be made more rapidly with it than with the ordinary needle-instrument; there being no time consumed in waiting for the needle to settle, or in avoiding the errors of local attraction.

When the sun is obscured the lines may be run by the needle alone, it being always kept with the sun, or at 0 on its arc, thus indicating the direction of the true meridian. The sun, however, must ever be regarded as the most reliable guide, and should, if possible, be taken at every station.

With a transit having both vertical and horizontal limbs, direct observations may be taken on the sun to find the meridian. The best time of day is about
DIRECT OBSERVATION. three hours before or after noon. A colored or smoked glass darkener will be necessary over the eyepiece to protect the eye. The observations to be taken are those of the altitude of the sun and its horizontal angle from a fixed point, at the same instant. It is best to take a number of these, say, three or five, so as to check; and if the telescope is reversed and another set taken, the mean of the two sets will eliminate many inaccuracies. It is also an advantage to use the lower limb of the sun in the morning and the upper limb in the afternoon — it being easier to judge the tangency of image and cross-wires. Allowance is then made for the semi-diameter of the sun, which varies from $15\frac{3}{4}$ to $16\frac{1}{4}$ minutes. It will be sufficiently close to have the vertical wire bisect the sun, but the altitude must

be taken with care. It will be understood that the transit must be accurately leveled and adjusted.

To reduce the observations there are many forms, all deduced from the same formula. The form much favored is $\tan^2 \frac{1}{2}A = \frac{\sin [S-(90^\circ-\text{alt.})] \cdot \sin [S-(90^\circ-\text{lat.})]}{\sin S \sin [S-(90^\circ-\text{dec.})]}$

REDUCTION-FORMULA. In which "A" is the azimuth of the sun or horizontal distance from the meridian, and "S" is one-half the sum of $(90^\circ-\text{alt. corrected for refraction})+(90^\circ-\text{lat.})+(90^\circ-\text{dec.})$ Note the sign of the declination. When South would be $(90^\circ-(\text{—dec.})=90^\circ+\text{dec.}$

EXAMPLE: Place, Troy, N. Y. Time 3h. 30m. P. M., March 31, 1902.

The horizontal angle from a fixed point to sun's center, .	241° 46'
Observed altitude of upper limb of sun,	30° 31' 10''
Obs alt. — refraction 1' 40''—semi diameter 16'=alt. of sun's center,	30° 13' 30''
Declination for day and hour,	4° 30' 30''
Latitude,	42° 44'
90°—alt. = 59° 46' 30'', 90°—dec. = 85° 29' 30'',	
90°—lat. = 47° 16', 2 S = 192° 32', S =	96° 16'
log. sin [S—(90°—alt.)] = 9 77480	
log. sin [S—(90°—lat.)] = 9 87778	
	<hr/> 9.65208
log. sin S =	9.99740
log. sin [S—(90°—dec.)] = 9 27173	
	<hr/> 9.26918
log. $\tan^2 \frac{1}{2}A = 0.38295$	
log $\tan \frac{1}{2}A = 0.19148$	
$\frac{1}{2}A \approx 57^\circ 14' 25''$ and $A = 114^\circ 28' 50''$ West of North.	

If in the morning would be East of North.

Apply this to the horizontal angle from the fixed point to the sun and we have $356^\circ 14' 50''$, which is the reading of the horizontal limb when the telescope is pointed North.

Set this reading off on the limb and the telescope will be in the plane of the meridian.

No. 192. SOLAR SCREEN.

If desired, we will furnish, at a cost of \$5.00, a simple solar screen arranged to clamp to the eyepiece end of the telescope, and detachable at will. On this screen the image of the sun and cross-wires can readily be observed. A greater movement to the eyepiece is required, however.

PATENT LATITUDE-LEVEL

This attachment, shown in the cut on page 31, is used for recovering the latitude on a Solar Transit without referring to the vertical arc ; and generally for setting the telescope at any desired angle in running grades and similar work.

It consists of a level connected by a short conical socket with the end of the telescope axis, to which it is clamped by a milled head screw, and made adjustable by a tangent screw and spring on the enlarged end of the tube. When the clamp-screw is released the level turns vertically upon the axis, and can thus be set at any angle with the telescope, the final adjustment being made by the tangent screw.

The latitude being set off upon the vertical arc as usual, the level is clamped and brought into the middle as above described.

The telescope may then be released and used in running lines, until it is desired to recover the latitude again ; this is easily and accurately done by the level alone without referring to the vertical arc.

Its use in running any desired grade is readily understood.

We make no additional charge for this attachment when furnished with a new solar instrument ; when added to our old Solar Transits the cost will be \$6 00.

R. M. JONES' LATITUDE ARC.

In this attachment the usual vertical arc is omitted, and replaced by a double latitude arc attached to the under side of the telescope, as shown above. The smaller arc, having its center directly under the cross-bar of the telescope, has an arm with vernier reading the arc to single minutes, and carries also a level-tube open at both top and bottom, with a scale over each opening.

In obtaining latitudes with this attachment, the declination being set off as usual, the level-bubble should be brought into the middle of its scale when the sun is on the meridian.

The reading of the smaller arc then gives the latitude of the place and in all further observations of the latitude reference is made to the level rather than to the graduations, the level being easily brought into the middle of the scale. This enables the surveyor to recover the latitude more rapidly than with the ordinary vertical arc.

Minute changes, as long lines are run either north or south, may be computed and set off on the larger arc, which reads by its vernier to ten seconds of arc.

The solar apparatus can also be used when the telescope is revolved and the apparatus brought below it, the latitude being now ascertained by reference to the other side of the level with its scale.

But one test of the adjustment of this attachment is required:—that both arcs should read zero when the telescope is made horizontal by its long level, and the smaller level of the arc below is also brought to the middle of its scale.

If not correct, they may be adjusted by loosening the screws by which each arc is confined, and moving the arcs until the zeros of both are in coincidence with the zeros of their verniers, care being taken to set the screws firmly again.

PRICES.

JONES' Latitude Arc, with reversible level-bubble... ..	\$73.00
When furnished with a new Transit of our make in place of the ordinary vertical arc, the JONES' Latitude Arc, with reversible level-bubble, increases the cost of the instrument	55 00
Thus: The Light Mountain Transit, with Solar Attachment and JONES' Latitude Arc, costs.....	300.00

TO ADJUST THE SOLAR ATTACHMENT.

The declination arm is first detached by removing the **SOLAR LENSES** clamp and tangent screws and the center **AND LINES.** with its small screws, by which the arm is attached to the arc.

The adjuster, which is a short bar furnished with every instrument, is then substituted for the declination arm, the center screwed into its place at one end, and the clamp-screw into the other, being inserted through the hole left by the removal of the tangent screw, thus securing the adjuster firmly to the arc.

The declination arm is then placed on the adjuster, one end is turned to the sun, and brought into such a position that the image of the sun is brought precisely between the equatorial lines on the opposite plate.

Carefully turn the arm over, until it rests upon the adjuster by the opposite faces of the rectangular blocks, and again observe the sun's image. If it remains between the lines as before, the arm is in adjustment. If not, loosen the three small screws and move the silver plate under their heads until one-half the error in the position of the sun's image is removed.

Bring the image again between the lines, and repeat the operation as above on both ends of the arm, until the image will remain between the lines of the plate in both positions of the arm, when it will be in proper adjustment, and the arm may be replaced in its former position on the attachment. This adjustment is very rarely needed in our instruments, the lenses being cemented in their cells and the plates securely fastened.

To adjust the Vernier of the Declination Arc: Set the vernier at zero, and then raise or lower the telescope until the sun's image appears exactly between the equatorial lines.

Having the telescope axis clamped, carefully revolve the arm until the image appears on the other plate. If precisely between the lines, the adjustment is complete; if not, move the declination arm by its tangent screw until the image will come precisely between the lines on the two opposite plates; clamp the arm and remove the index error by loosening two screws that fasten the vernier; place the zeros of the vernier and limb in exact coincidence, tighten the screws, and the adjustment is complete.

To adjust the Polar Axis: First, level the instrument carefully by the long level of the telescope, using in the operation the tangent movement of the telescope axis in connection with the leveling-screws, until the bubble will remain in the middle during a complete revolution of the instrument upon its axis.

Place the solar apparatus upon the axis and see that it moves easily around it; bring the declination arm in the same vertical plane with the telescope, place the Adjusting-Level, No. 196 (see below), upon the top of the rectangular blocks, and bring the bubble of the level into the middle by the tangent screw of the declination arc.

No. 196.

STRIDING OR ADJUSTING-LEVEL.

Then turn the arc half-way around, bringing it again parallel with the telescope, and note the position of the level. If in the middle, the polar axis is vertical in that direction ; if not in the middle, correct one-half of the error by the capstan-head adjusting screws under the base of the polar axis, moving each screw of the pair the same amount, but in an opposite direction. Bring the level to the middle again by the tangent screw of the declination arc, and repeat the operation as before, until the bubble will remain in the middle when the adjusting-level is reversed.

Pursue the same course in adjusting the arc in the second position, or over the telescope axis, and when completed the level will remain in the middle during an entire revolution of the arc, showing that the polar axis is at right angles with the level under the telescope, or truly vertical.

As this is by far the most delicate and important adjustment of the Solar Attachment, it should be made with the greatest care, the bubble kept perfectly in the middle and frequently inspected in the course of the adjustment.

The Adjusting-Level in the operation just described is supposed to be itself in adjustment ; but if not, it can be easily corrected by the screw shown at one end, when reversed upon a plane surface, exactly as a mason's level is adjusted.

To adjust the Hour-Arc : Whenever the instrument is set in the meridian, as will be hereafter described, the index of the hour-arc should read apparent time.

HOURLY-ARC. If not, loosen the two flat head screws on the top of the hour-circle, and with the hand turn the circle around until it does, fasten the screws again, and the adjustment will be complete.

To obtain *mean time*, the correction of the equation for the given day, as found in the Nautical Almanac, should always be applied.

To obtain *standard time*, apply the difference in longitude between the locality and the nearest standard meridian to the *mean time*.

ASTRONOMICAL TERMS.

WE DEFINE, in the few pages following, the terms employed in the use and adjustment of the solar apparatus, as being of service to one not familiar with solar instruments.

SUN. The Sun is the center of the solar system, remaining constantly fixed in its position, although, for the sake of convenience, often spoken of as in motion around the earth.

EARTH. The Earth makes a complete revolution around the sun in three hundred and sixty-five days, five hours, forty-eight minutes and forty-six seconds.

It also rotates about an imaginary line passing through its center, and termed its axis, once in twenty-three hours, fifty-six minutes and four seconds, mean time, turning from west to east.

The Poles are the extremities of the axis ; that in our own hemisphere, known as the north pole, if
POLES. produced indefinitely toward the concave surface of the heavens, would reach a point situated near the polar star, and called the north pole of the heavens.

The Equator is an imaginary line passing
EQUATOR. around the earth, equi-distant from the poles, and in a plane at right angles with the axis

If the plane of the equator be produced to the heavens, it forms what is termed the celestial equator.

The Orbit of the earth is the path in which it moves in making its yearly revolution. If the plane of
ORBIT. this orbit were produced to the heavens, it would form the ecliptic, or the sun's apparent path in the heavens.

The earth's axis is inclined to its orbit at an angle of about $23^{\circ} 27'$, making an angle between the earth's orbit and its equator, or between the celestial equator and the ecliptic, of the same amount.

EQUINOXES. The Equinoxes are the two points in which the ecliptic and the celestial equator intersect one another.

The Declination of the Sun is its angular distance north or south of the celestial equator; when the sun is at the equinoxes, that is, about the 21st of **DECLINATION OF SUN.** March and the 21st of September of each year, its declination is 0, or it is said to be on the equator; from these points its declination increases from day to day, and from hour to hour, until on the 21st of June and the 21st of December it is $23^{\circ} 27'$ distant from the equator.

It is the declination which causes the sun to appear so much higher in summer than in winter, its altitude in the heavens being about $46^{\circ} 54'$ more on the 21st of June than it is on the 21st of December.

The Horizon of a place is the surface which is defined by a plane supposed to pass through the place at right angles with a vertical line, and to bound our **HORIZON.** vision at the surface of the earth. The horizon, or a horizontal surface, is determined by the surface of any liquid when at rest, or by the spirit-levels of an instrument.

The Zenith of any place is the point **ZENITH.** directly overhead, in a line at right angles with the horizon.

The Meridian Circle of any place is a **MERIDIAN.** great circle passing through the zenith of a place and the poles of the earth.

The meridian, or true north and south line of any place, is the line determined by the intersection of the plane of the meridian circle with the plane of the horizon.

MERIDIAN ALTITUDE. The Meridian Altitude of the sun is its angular elevation above the horizon, when passing the meridian of the place.

LATITUDE. The Latitude of a place is its distance north or south of the equator, measured on the meridian. At the equator the latitude is 0° , at the poles 90° .

The Longitude of a place is its angular distance east or west of a given place taken as the starting-point or first meridian ; it is measured on the equator or on any parallel of latitude.

In the Nautical Almanac, which is commonly used with a solar instrument, the longitude of the principal places in the United States is reckoned from Greenwich, England, and expressed both in degrees and hours.

The Zenith Distance of any heavenly body is its angular distance north or south of the zenith of a place, measured when the body is on the meridian.

Suppose a person to be on the equator at the time of an equinox ; the sun, when on the meridian, would be in the zenith of the place, and the poles of the earth would lie in the plane of its horizon.

Disregarding, for the present, the declination of the sun, let us suppose that the person travels toward the north pole. As he passes to the north, the sun will descend from the zenith, and the pole will rise from the horizon in the same proportion, until when he arrives at the north pole of the earth the sun will have declined to the horizon, and the pole of the heavens will have reached the zenith.

The altitude of the pole at any place, or the distance of the sun from the zenith, would, in the case supposed, give the observer the latitude of that place.

If we now take into account the sun's declination, it will increase or diminish its meridian altitude, according as it passes north or south of the equator; but the declination of the sun at any time being known, its zenith distance, and therefore the latitude of the place, can be readily ascertained by an observation made when the sun is on the meridian. It is by this method that we obtain the latitude of any place by the Solar Compass.

A solar day is the interval of time between the departure of the sun from the meridian of a place, and its succeeding return to the same position. The **TIME.** length of the solar day, by reason of the inclination of the earth's axis, is constantly changing.

In order to have a uniform measure of time, we have recourse to what is termed a *mean solar day*, the length of which is equal to the mean or average of all the solar days in a year.

The time thus given is called *mean solar time*, and is the same at any instant for all points on the same meridian, differing, however, at points on different meridians.

Since November, 1883, in the United States, the *mean solar time* of the meridians 60° , 75° , 90° , 105° and 120° west of Greenwich are adopted as **STANDARD TIME.** *standard time*, and are called respectively Colonial, Eastern, Central, Mountain, and Pacific time. Each differs from the next in time by one hour. Instead of employing the local *mean solar time*, the time used is the *mean solar time* at the nearest of the standard meridians.

At Troy, N. Y., the longitude is $73^{\circ} 40'$ west, or four hours, fifty-four minutes and forty seconds; hence the *mean solar time* is five minutes and twenty seconds more than the *standard time*. At Minneapolis the longitude is six hours, twelve minutes and fifty-seven seconds; hence the *mean solar time* is twelve minutes and fifty-seven seconds less than *standard time*, since the city is west of the meridian.

**EQUATION OF
TIME.**

The sun is sometimes faster and sometimes slower than the clock, the difference being called the *equation of time*.

The moment when the sun is on the meridian of any place is called *apparent noon*, and this being ascertained,

**APPARENT
NOON.**

we can, by adding the equation of time for the given day to, or subtracting from, apparent noon, according as the sun is slow or fast, obtain the time of *mean noon*, which, converted to *standard time*, is used to set the watch.

As the earth makes a complete rotation upon its axis once a day, every point on its surface must pass over three

**DIFFERENCE OF
LONGITUDE.**

hundred and sixty degrees in twenty-four hours, or fifteen degrees in one hour, and so on in the same ratio. And as the rotation is from west to east, the sun would come to the meridian of every place fifteen degrees west of Greenwich just one hour later than the time given in the Ephemeris for apparent noon at that place.

To an observer situated at Troy, N. Y., the longitude of which is, in time, four hours, fifty-four minutes, forty seconds, the sun would come to the meridian nearly five hours later than at Greenwich, and thus when it was 12 M. at that place it would be but about 7 A. M. in Troy.

By reason of the atmosphere, the rays of light from the sun are bent out of their course, so as to
REFRACTION. make its altitude appear greater than is actually the case.

The amount of refraction varies according to the altitude of the body observed ; being zero when it is in the zenith, about one minute when midway from the zenith to the horizon, and almost thirty-four minutes when in the horizon.

The proper allowance to be made for refraction in setting off the declination is explained fully on pages 69-76.

If the latitude and declination of the sun were both at zero, the position of the sun at noon would be at the zenith

EFFECT OF and there would be no refraction. At any
REFRACTION. other latitude, declination or hour, the apparent position of the sun would be lower and refraction must be taken into account. As refraction is due to altitude, it might be suggested to lay it off directly on the vertical limb ; but as this would alter the inclination of the polar axis, it must be applied to the declination arc, and modified to suit the proper inclination of the arc due to latitude, declination and hour angle.

Again, the angle which the equatorial lines make with the horizon is continually changing, as the arm is made to follow the motion of the sun during the course of a day.

Thus, in the morning and evening they are more or less inclined to the horizon, while at noon they are exactly parallel with it. And thus it follows that the excess of refraction at morning and evening is in some measure balanced by the fact that the position of the sun's image with reference to the equatorial lines is then less affected by it, on account of the greater inclination of the lines to the horizon.

THE SOLAR COMPASS.

THIS instrument, so ingeniously contrived for readily determining a true meridian, or north and south line, was invented by WILLIAM A. BURT, of Michigan, and patented by him in 1836. It came into general use in the surveys of the U. S public lands, the principal lines of which are required to be run with reference to the true meridian.

The invention long since became public property, and for nearly fifty years the Solar Compass has been manufactured by us, with improvements of our own, which have made it increasingly popular and efficient.

The arrangement of its sockets and plates is similar to that of the Surveyor's Transit, as shown on page 34, except that the sight-vanes are attached to the under plate or limb, and this revolves around the upper or vernier plate on which the solar apparatus is placed.

The limb is graduated to half degrees, is figured in two rows, 0 to 360 and 0 to 90 each way, and reads by the two opposite verniers to single minutes.

The graduations of the limb and all other arcs of the Solar Compass are made upon sterling silver.

THE SOLAR APPARATUS.

The solar apparatus is seen in the place of the needle, and, in fact, operates as its substitute in the field.

It consists mainly of three arcs of circles, by which can be set off the latitude of a place, the declination of the sun, and the hour of the day.

TO ADJUST THE SOLAR COMPASS.

The adjustments of this instrument with which the surveyor will need to be familiar are simple and few in number, and will now be mentioned in order.

(1) To adjust the levels: Proceed as directed in the account of the other instruments we have described, by bringing the bubbles into the middle of the tubes by the leveling-screws, and then reversing the instrument upon its spindle and raising or lowering the ends of the tubes, until the bubbles will remain in the middle during a complete revolution of the instrument.

(2) To adjust the Equatorial Lines and Solar Lenses: Same as page 85.

(3) To adjust the Vernier of the Declination Arc: Same as page 86.

(4) To adjust the Solar Apparatus to the Compass-Sights: First level the instrument, and with the clamp and tangent screws set the main plate at ninety degrees by the verniers and horizontal limb. Then remove the clamp and tangent screws, and raise the latitude arc until the polar axis is by estimation very nearly horizontal, and, if necessary, tighten the screws on the pivots of the arc, so as to retain it in this position.

Fix the vernier of the declination arc at zero, and direct the outside edges of the lens blocks to some distant and well-marked object, and observe the same through the compass sights. If the same object is seen by both observations, and the verniers read to ninety degrees on the limb, the adjustment is complete; if not, the correction must be made by moving the compass-sights or changing the position of the verniers.

It should be remarked that as the solar work is attached permanently to the sockets, and this adjustment made by

No. 210.

Price as shown, including leveling-screws and clamp and tangent to spindle, and with tripod, \$210.00.

the maker, it will need no further attention at the hands of the surveyor except in case of serious accident

The other adjustments are, of course, also made in the process of finishing the instrument, and are liable to very little derangement in the ordinary use of the Solar Compass.

This instrument should always be used on a **TRIPOD**. tripod, with screws for ready and accurate leveling, and a tangent screw for directing it to any desired point

For this purpose a leveling-head with tangent screw, similar to those shown in the cut of the Surveyors' Transit, is furnished with every instrument.

TO RUN LINES WITH THE SOLAR COMPASS.

Having set off the latitude and declination upon their respective arcs, the instrument being also in adjustment, the surveyor is ready to run lines by the sun.

To do this, the instrument is set over the station and carefully leveled, the plates clamped at zero on the horizontal limb, and the sights directed north and south, the direction being approximately given, when unknown by the needle.

The solar lens is then turned to the sun, and, with one hand on the instrument and the other on the revolving

TRUE arm, both are moved from side to side, until **MERIDIAN**. the sun's image is made to appear on the silver plate. By carefully continuing this operation the image may be brought precisely between the equatorial lines. The line of sight will indicate the true meridian, and the observation may now be made and the flagman be put in position.

When a due east and west line is to be run, the verniers of the horizontal limb are set at ninety degrees, and the sun's image kept between the lines, as before.

The Solar Compass being so constructed that when the sun's image is in position the limb must be clamped at zero in order to run a true meridian line, it will be evident that the bearing of any line from the meridian may be read by the verniers of the limb precisely as in the ordinary magnetic needle Compass the bearing of lines is read from the ends of the needle.

In running lines the magnetic needle may be kept with the sun; that is, the point of the needle is made to indicate

USE OF zero on the arc of the compass-box, by
THE NEEDLE turning the tangent screw connected with its arm on the opposite side of the plate. By this means the lines can be run by the needle alone in case of the temporary disappearance of the sun; but, of course, in such instances, the surveyor must be sure that there is no local attraction. The variation of the needle, which is noted at every station, is read off on the arc by the vernier on the arm of the needle-box.

In using the Compass, if the revolving arm be turned a little to one side of its proper position, a false or reflected

FALSE IMAGE. image of the sun will appear on the silver plate in nearly the same place as that occupied by the true one. It is caused by the reflection of the true image from the surface of the arm, and is a fruitful source of error to the inexperienced surveyor. It can, however, be readily distinguished from the real image by being much less bright, and not so clearly defined.

When the bearings of lines, such as the course of a stream or the boundaries of a forest, are not desired with

the certainty given by the verniers and the horizontal limb, a rough approximation of the angle which they make with the true meridian is obtained by **APPROXIMATE BEARINGS.** the graduations on the outside of the circular plate. In this operation, a pencil or thin straight-edge of any kind is held perpendicularly against the circular edge of the plate, and moved around until it is in range with the eye, the brass center-pin, and the object observed. The bearing of the line is then read off at the point where the pencil is placed.

SUPERIORITY OF OUR SOLAR COMPASSES.

The Solar Compass as first made, though planned with great ingenuity in its general arrangement, was still extremely rude in its mechanical details and adjustments.

The points in which we claim the superiority of our Solar Compass over any other manufactured, and by means of which the defects just mentioned are entirely removed, are partially shown in the various cuts already given, and will now be stated in detail.

1. A motion of the horizontal plates entirely free from friction, combined with perfect rigidity.
2. A tangent movement to the limb, as shown under the plate.
3. A tangent movement with clamp to the declination arc.
4. A tangent movement with clamp to the latitude arc
5. A tangent movement for the whole instrument about its socket.
6. Increased facility of adjustment, and therefore an important saving of time.

WEIGHT. The Solar Compass with leveling-head, but without tripod, weighs about fifteen pounds.

THE RAILROAD COMPASS.

THE ordinary Compass is used in surveys where great accuracy is not required, and where land is abundant and cheap. It is very difficult, however, to measure horizontal angles accurately and minutely by the needle alone ; and in some localities needle-instruments are considered so untrustworthy that Land Surveyors are forbidden to use an instrument unless it is capable of taking angles independently of the needle.

To meet the demand for more accurate work than can be done with the ordinary Compass, the Railroad Compass has been devised. This instrument is a **Compass of the highest grade, with a graduated limb and verniers like those of the Transit.** It has, as shown on page 104, the main plate, levels, sights, and needle of the ordinary instrument, and, in addition, underneath the main plate, a graduated circle or limb by which horizontal angles to single minutes can be taken independently of the needle.

The limb is figured in two rows, 0 to 360 and 0 to 90 each way.

The arrangement of the sockets is like that of the Surveyors' Transit with two verniers to limb, **SOCKETS.** and the plates can be separated and replaced in the same manner.

The sockets upon which the plates of this instrument turn are long and well-fitted and the movement of the vernier plate around the limb is almost entirely free from friction.

The verniers are attached to the under surface of the main plate at an angle of thirty degrees with the line of sights, the openings through which they are seen being covered with glass to protect the graduations from dust and moisture. **VERNIERS.**

NO. 216.

Railroad Compass, with two verniers to limb, $5\frac{1}{2}$ -inch needle and staff mountings.
Price, \$75.00.

The connection between the two plates is made by a clamp and tangent movement with opposing spring, shown at *t* underneath the plates.

The needle-lifting screw is shown at *n*, on the left of the plate. On the right of the Compass-circle is seen the head of a pinion working into a rack fixed to the edge of the compass-circle, thus enabling the surveyor to move the compass-circle about its center in setting off the variation of the needle, as described on page 113.

The variation is read to single minutes by a vernier and graduated arc, partially shown in the cut.

A clamp screw is shown at *c*, by which the circle is securely fixed when moved to the proper position.

TO USE THE RAILROAD COMPASS.

The Railroad Compass can be used upon the common ball-spindle or, still better, upon the tangent ball, placed either in a staff socket, a compass tripod, or the leveling-adoppter and tripod, as shown on page 122.

We have also adapted to many of these instruments the leveling-head with the clamp and tangent movement and tripod, and this is preferable to any other support. (See page 123.)

To take Horizontal Angles: First level the plate and set the limb at zero, fix the sights upon one of the objects selected, and clamping the whole instrument to the spindle, unclamp the vernier plate and turn it with the hand until the sights are brought nearly upon the second object; then clamp to the limb, and with the tangent screw fix them precisely upon it.

The number of degrees and minutes read off by the vernier will give the angle between the two objects taken from the center of the instrument.

It will be understood that horizontal angles can be taken in any position of the verniers with reference to the zero point of the limb ; we have given that above as being the usual method, and liable to the fewest errors.

Where great accuracy is required, it is advisable, in this and other instruments which have two verniers, to obtain the readings of the limb from both, add the two together and halve their sum ; the result will be the mean of the two readings, and the true angle between the points observed.

Such a course is especially necessary when the readings of the verniers essentially disagree, as may sometime happen when the instrument has been injured by an accident.

In taking horizontal angles as just described, the magnetic bearings of the two objects are often noted, and thus two separate readings of the same angle, **USE OF THE NEEDLE.** one by the limb and the other by the needle, are obtained, to be used as checks upon each other to prevent mistakes.

To turn off the variation of the needle : Having leveled the instrument, set the limb at zero and place the sights upon the old line, note the reading of the needle, and make it agree with that given in the field-notes of the former survey by turning the compass-circle about its center by the pinion-head. **MAGNETIC DECLINATION.**

Now clamp the compass-circle, and the number of degrees or minutes passed over by the vernier of the compass-circle will be the change of magnetic declination in the interval between the two surveys.

To survey with this instrument, the operator should turn the south end of the compass towards his person, **USING THE** and having brought the zeros of the limb **COMPASS.** and vernier plate in line, clamp them, and proceed as directed in our account of the Vernier Compass.

The Telescopic Sight, as hereafter described, is often used with the Railroad Compass with excellent results.

It will be understood that lines can be run and angles measured by the graduated limb and verniers, independently of the needle; and in places where local attraction is manifested this is very desirable.

The accuracy and minuteness of horizontal angles indicated by this instrument, together with its perfect adaptation to all the purposes for which the Vernier Compass can be used, have brought it into use in many localities where land is so valuable as to require more careful surveys than are practicable with a needle-instrument.

Size and Weight of the Railroad Compass with two Verniers: We make two sizes of this instrument, viz.:
SIZE AND with five and five and one-half-inch needles;
WEIGHT. the smaller size, including the brass head of the staff, weighs thirteen pounds, and the instrument with five and one-half-inch needle weighs about fourteen pounds.

RAILROAD COMPASS, ONE VERNIER TO LIMB.

This instrument is essentially like that already described, but of somewhat simpler construction in its sockets; and, though offered at a price materially lower than the other, it is in every way accurate and reliable.

Size and Weight of the Railroad Compass with one vernier: We make but one size of this instrument, with five and one-half-inch needle, which weighs about thirteen pounds.

THE VERNIER COMPASS.

THIS instrument, shown on page 110, has its compass-circle, to which is attached a vernier, movable about its center a short distance in either direction, enabling the surveyor to set the zeros of the circle at any required angle with the line of sights. The number of degrees contained in this angle (or the variation of the needle) is read off by the vernier.

The Compass-Circle in this, as in all our instruments, is graduated to half degrees on its upper surface, the whole degree marks being also cut down on the inside circumference, and is figured from 0 to 90 on each side of the middle or line of zeros. The circle and face of the Compass are silvered. The movement of the circle is effected either by a tangent screw, as shown in the cut, or by a concealed rack and pinion, the head of which projects from the under side of the main compass-plate. When the variation is set off as described, the circle is fastened in its position by a clamp-screw.

The Compass is fitted to a spindle made slightly conical, and having on its lower end a ball turned perfectly spherical, and confined in a socket by a pressure so light that the ball can be moved in any direction in leveling the Compass. The ball is placed either in the brass head of the staff or, better, in the compass tripod seen in the cut of the Vernier Transit on page 47.

A leveling-adopter, shown on page 122, is also often used for more convenient leveling of the Compass.

The Staff Mountings consist of the brass head already mentioned, and a pointed steel shoe. The staff, to which the mountings should be securely fastened, is procured from any wheelwright, or selected by the surveyor himself from a sapling of the forest.

STAFF MOUNTINGS. The Spirit-Levels are placed at right angles with each other so as to level the plate in all directions, and are balanced upon a pivot under the middle of the tube, so as to be adjustable by a common screw-driver.

The Sights, or sight-vanes, have fine slits cut through nearly their whole length, terminated at intervals by circular apertures, through which the object sighted upon is more readily found. Sometimes a fine horse-hair or wire is substituted for half the slit, and placed alternately with it on opposite sights.

SIGHTS. The Telescopic Sight is often supplied with the Vernier Compass, and its adjustments and use are described on pages 124-130.

The right and left edges of the sights of our Compasses have respectively an eyepiece and a series of graduations, by which angles of elevation and depression, for a range of about twenty degrees each way, can be taken with considerable accuracy.

TANGENT SCALE. This arrangement is very properly called a tangent scale, the graduated edges of the north sight being tangents to segments of circles having their centers at the eyepieces, and their points of contact with the tangent lines at the zero graduations of the scale.

The cut shows the eyepiece and graduations for angles of elevation ; those for angles of depression, not shown in this cut, are seen in the cut of the Plain Compass.

Vernier Compass, 6-inch needle, with staff mountings.
Price, \$40.00.

In the side of the hollow socket of the Compass, which fits the ball-spindle, is a screw by which
CLAMP-SCREW. the instrument may be clamped to the spindle in any position.

Besides the clamp-screw there is fitted to the sockets of our Compasses a spring-catch, which,
SPRING-CATCH. as soon as the instrument is set upon its spindle, slips into a groove, and thus removes all danger of the instrument falling off the spindle while being carried.

There is underneath the main plate a needle-lifting screw which, by moving a concealed
NEEDLE-LIFTER. spring, raises the needle from the pivot and thus prevents the blunting of the point in transportation.

When the Compass is not in use, it is the practice of many surveyors to let down the needle upon the point of the center-pin and let it assume its position in the magnetic meridian, so as to retain its polarity. We would advise that after the needle has settled it should be raised against the glass, in order not to dull the point of the center-pin.

A small dial-plate, having an index turned by a milled head underneath, is used with this and other
OUTKEEPER. Compasses to keep tally in chaining. The dial is figured from 0 to 16, the index being moved one notch for every chain run.

A brass cover is fitted over the glass of
BRASS COVER. the Compass, and serves to protect it from accident, as well as to prevent electric disturbance.

The superiority of the Vernier over the Plain Compass
USE OF THE VERNIER. consists in its adaptation to retracing the lines of an old survey, and to the surveys of the U. S. public lands, where the lines are based on a true meridian.

It is well known that the magnetic needle in almost all parts of the United States points more or less to the east **VARIATION OF** or west of a true meridian, or north and **THE NEEDLE.** south line. This deviation, which is called the *variation of the needle*, is not constant, but increases or decreases to a very sensible amount in a series of years.

Thus at Troy, N. Y., a line bearing in 1871, N. 31° E., would in 1901, with the same needle, have a bearing of about N. $32^{\circ} 49'$ E., the needle having thus in that interval traveled nearly $1^{\circ} 49'$ to the west.

For this reason, in running over the lines of a farm from field-notes of some years' standing, the surveyor is obliged to make an allowance, both perplexing and uncertain, in the bearing of every line. To avoid this difficulty the Vernier Compass was devised.

The Vernier is graduated on its edge into **VERNIER.** thirty equal parts, and figured in two series on each side of the middle line

In the same plane with the vernier is an arc or limb, fixed to the main plate of the Compass, and graduated to half degrees.

Each space on the vernier is one minute shorter than a single space on the limb.

The surfaces of both vernier and limb are silvered.

In reading the vernier, if it is moved to the right, count the minutes from its zero point to the right, and *vice versa*.

TO READ Proceed thus until a graduation on the **THE VERNIER.** vernier is found exactly in line with another on the limb, and the first row of figures on the vernier will give the number of minutes passed over. When the vernier is moved more than fifteen minutes to either side, the number of additional minutes, up to thirty.

or one-half degree of the limb, is given by the second row of figures on the opposite side of the vernier.

To read beyond thirty, add the minutes given by the vernier to that number, and the sum will be the correct reading.

In all cases when the zero-point of the vernier passes a whole degree of the limb, this must be added to the minutes, in order to define the distance over which the vernier has been moved.

It will be seen that the surveyor having the Vernier **TO SET OFF** Compass can, by moving the vernier to **THE VARIATION.** either side, and with it, of course, the compass-circle attached, set the Compass to any variation.

He therefore places his instrument on some well-defined line of the old survey, and turns the tangent screw until the needle of his Compass indicates the same bearing as that given in the field-notes of the original survey.

Then, clamping the vernier, he can run all the other lines from the old field-notes without further alteration.

The reading of the vernier on the limb in such a case would show the change of variation of the two different periods.

The variation of the needle at any place being known, a true meridian, or north and south line, may be run by moving the vernier to either side, as the variation is east or west, until the arc passed over on the limb is equal to the angle of variation, and then turning the Compass until the needle is made to cut the zeros on the graduated circle. The line of sights will then give the direction of the true meridian of the place.

Such a change in the position of the vernier is necessary in surveying the U. S. public lands, which surveys are always run from the true meridian.

The line of no declination, or variation, as it is called, or the line upon which the needle will indicate a true north **LINE OF NO** and south direction, is situated in the United **VARIATION.** States nearly in an imaginary line drawn from Sault Ste. Marie, Michigan, to Charleston, South Carolina. A compass-needle, therefore, placed east of this line, has a variation to the west, and when placed west of the line the variation is to the east; and in both cases it increases as the needle is carried farther from the line of no variation.

Thus, in Minnesota, the variation is from eight to eleven degrees to the east, while in Maine it is from fifteen to nineteen degrees to the west. At Troy, in the present year, 1902, the variation is about $11^{\circ} 09'$ to the west, and is increasing in the same direction about two minutes annually.

The variation of the magnetic needle does not remain constant through an entire day; but it reaches its farthest **DIURNAL** point east about 8 o'clock, A. M., and its **VARIATION.** farthest point west about 2 o'clock, P. M. The cause of this daily variation of the needle is not understood, as observations show that it is greater in summer than in winter.

Conditions of temperature, magnetic storms and other causes at times affect the needle. Our own experiments show that different needles observed at the same time and under the same conditions differ in their direction, but show nearly the same daily change.

A less important use of the vernier is to give a reading of the needle to single minutes, which is obtained as follows:

First be sure, as in all observations, that the zero of the vernier exactly corresponds with that of the limb; then, noting the number of the whole degrees given by the needle, move back the compass-circle with the tangent screw until the nearest whole degree mark is made to coincide with the point of the needle, read the vernier as before described, and this reading added to the whole degrees will give the bearing to minutes.

TO ADJUST THE COMPASS.

To adjust the Levels: First bring the level-bubbles into the middle by the pressure of the hand on different parts of the plate, and then turn the Compass half-way around; should the bubbles run to the end of the tubes, it would indicate that those ends were the highest; lower them by loosening the screws under the lowest ends and tightening those under the highest ends until, by estimation, the error is half removed; level the plate again, and repeat the first operation until the bubbles will remain in the middle during an entire revolution of the Compass.

The sights may next be tested by observing through the slits a fine hair or thread, made exactly vertical by a plummet. Should the hair appear on the side of the slit, the sight must be adjusted by filing its under surface on the side which seems the highest.

To adjust the Needle: Having the eye nearly in the same plane with the graduated rim of the compass-circle, with a small splinter of wood or a slender iron wire bring one end of the needle in

line with any prominent graduation of the circle, as the zero or the ninety degree mark, and notice if the other end corresponds with the degree on the opposite side ; if it does the needle is said to "cut" opposite degrees ; if not, bend the center-pin by applying a small brass wrench, furnished with our Compasses, about one-eighth of an inch below the point of the pin, until the ends of the needle are brought into line with the opposite degrees.

Then, holding the needle in the same position, turn the Compass half-way around, and note whether it now cuts opposite degrees ; if not, correct half the error by bending the needle, and the remainder by bending the center-pin. The operation should be repeated until perfect reversion is secured in the first position.

This being obtained, it may be tried on another quarter of the circle ; if any error is there manifested, the correction must be made in the center-pin only, the needle being already straightened by the previous operation.

When again made to cut, it should be tried on the other quarters of the circle, and corrections made in the same manner until the error is entirely removed, and the needle will reverse in every point of the graduated surface.

TO USE THE COMPASS.

In using the Compass, the surveyor should keep the south end towards his person, and read the bearings from the north end of the needle. He will observe that the E and W letters on the face of the Compass are reversed from their natural position, in order that the direction of the line of sight may be correctly read.

The compass-circle being graduated to half degrees, a little practice will enable the surveyor to read the bearings

to quarter degrees or even less, estimating with his eye the space bisected by the point of the needle ; and as this is as close as the traverse table is usually calculated, it is the general practice.

Having leveled the compass, bring the south end towards the person, and place the eye at the little button, **ANGLES OF ELEVATION.** or eyepiece, on the right side of the south sight, and with the hand hold a card on the front surface of the north sight, so that its top edge will be at right angles with the graduated edge and coincide with the zero mark. Then, sighting over the top of the card, note upon a flagstaff, held near the compass, the height cut by the line of sight, move the staff up the elevation and carry the card along the sight until the line of sight again cuts the same height on the staff ; read off the degrees and half degrees passed over by the card, and this will be the angle required.

ANGLES OF DEPRESSION. Proceed in the same manner, using the eyepiece and graduations on the opposite side of the sight, and reading from the top of the sight.

NEW AND OLD SURVEYS. When the Compass is to be used in making new surveys, the vernier should be set at zero and clamped by the nut beneath the plate.

In surveying old lines, the change of variation of the needle should be ascertained by setting the Compass on some well-defined line of the tract, and making the bearing to agree with that of the old survey, by moving the circle as already described.

Then the circle can be clamped, and the old lines retraced from the bearings given by the original surveyor.

When the variation of the needle is known, it can be set off by the vernier, and the Compass used to run a true meridian by the needle.

A little caution is necessary in handling the Compass, that the glass covering does not become charged with electricity excited by the friction of cloth, silk **ELECTRICITY.** or the hand, so as to attract the needle to its under surface. When, however, the glass becomes so charged, the electricity may be removed by breathing upon it, or by touching different parts of its surface with the moistened finger. Ignorance of this apparently trifling matter has caused many errors and perplexities in the practice of the inexperienced surveyor.

REPAIRS OF THE COMPASS.

To enable the surveyor to make such repairs as are possible without having recourse to an instrument-maker, we here add a few simple directions.

It may sometimes happen that the needle has **NEEDLE.** lost its polarity and needs to be remagnetized ; to do this, proceed as follows : Unscrew the bezel-ring that holds the glass face, remove the needle and pass with a gentle pressure each end of the needle from middle to extremity over the magnetic pole of an ordinary permanent magnet, describing before each pass a circle of about six inches radius, to which the surface of the pole is tangent, drawing the needle towards him, and taking care that the north and the south ends are applied to the *opposite* poles of the magnet.

Should the needle be returned in a path near the magnetic pole, the current induced by the contact of the needle and magnet, in the pass just described, would be reversed, and thus the magnetic virtue almost entirely neutralized at each operation.

When the needle has been passed about twenty-five times in succession in the manner just described it may be considered as fully charged.

The imperfect working of a compass needle is almost invariably due to a dull center-pin, or a roughened jewel center, and less frequently to loss of polarity or magnetism.

A fine brass wire is wound in two or three coils on the south end of the needle, and may be moved back or forth in order to counterpoise the varying weight of the north end.

The center-pin should occasionally be examined, and if much dulled, should be taken out with the brass wrench or

CENTER-PIN. with a pair of pliers, and sharpened on a hard oilstone, the operator placing it in the end of a small stem of wood, or a pin-vise, and delicately twirling it with the fingers as he moves it back and forth at an angle of about thirty degrees with the surface of the stone.

When the point is thus made so fine and sharp as to be invisible to the eye it should be smoothed by rubbing it on the surface of a soft and clean piece of leather.

To put in a new glass : Unscrew the bezel-ring which holds it, and with the point of a knife-blade spring out

GLASS CIRCLE. the little brass ring above the glass and remove the old glass and scrape out the putty. Then, if the new glass does not fit, smooth off its edges by holding it obliquely on the surface of a grindstone until it will enter the ring easily ; then put in new putty, spring in the brass ring, and the operation will be complete.

To replace a level-vial : Take out the screws which hold it to the plate, pull off the brass ends of

LEVEL-VIAL. the tube, and with a knife-blade scrape out the plaster from the tube. Then with a stick made a little smaller than the diameter of the tube, and with its end hollowed out so that it will bear only on the broad surface of the level-vial, push out the old vial and replace it with a new one, taking care that the crowning side, which has a file-mark on the end of the vial, is placed on the upper side.

When the vial does not fit the tube, it must be wedged up by putting little slips of paper under it, until it moves in snugly.

After the vial is in its place, put around its end a little plaster of Paris mixed with water to the consistency of putty, taking care not to allow any to cover the little tip of the glass, then slip in the brass ends, and the operation will be complete.

A little beeswax, melted and dropped upon the ends of the vial, is equally as good as the plaster of Paris, and often more easily obtained.

An extra glass and level-vials are always furnished, free of charge, with every new Compass.

We make three sizes of the Vernier Compass, having needles respectively four, five, and six inches long, the main plates being respectively twelve and one-half, **SIZES.** fifteen, and fifteen and one-half inches long. The sights of the smallest are also about an inch shorter than the others.

In the four and five-inch Vernier Compasses, the variation arc is within the compass-circle, like that of the Railroad Compass before described, and the variation is set off to minutes by a pinion-head underneath the plate, and this arc is clamped by a screw placed opposite the pinion.

The average weights of the different sizes, including the brass head of the staff, beginning with the **WEIGHTS.** smallest, are respectively six and one-quarter, eight and three-quarters, and ten and one-half pounds.

THE PLAIN COMPASS.

No. 232.

Price, with 6-inch needle and staff mountings, \$35.00.

THE Plain Compass shown in the cut has a six-inch needle, and is furnished with levels, sight-vanes, socket, etc.

The compass-box is in the same piece with the main plate, and the instrument is used chiefly in the surveys of new lines, or in the preparation of maps, where the variation of the needle is not required.

The adjustments and use of the Plain Compass are substantially the same as those of the Vernier Compass just described.

Three sizes of this instrument are in common use, having respectively four, five and six-inch needles, and differing also in the length of the main plate, which, in the four-inch Compass is twelve and one-half

SIZES.

inches long, and in the larger sizes fifteen and fifteen and one-half inches.

The average weights of the different sizes, **WEIGHT.** with the brass mountings of the staff, are as follows :

Plain Compass with 4-inch needle.....	6 lbs.
“ “ “ 5-inch “	7 $\frac{3}{4}$ lbs.
“ “ “ 6-inch “	9 $\frac{1}{2}$ lbs.

We manufacture a compound ball-spindle, which has a **COMPOUND BALL-SPINDLE.** tangent movement, and which gives all the perfection of more costly arrangements at a very moderate expense. The price is \$7.00.

As represented in the cut, No. 240, it has an interior spindle, around which an outside hollow cylinder is moved by turning the double-headed tangent screw, which has in the middle a screw, working into teeth cut spirally around the cylinder. The Compass or other instrument revolves on the outside socket, exactly as if placed on a common ball-spindle ; but when a slower movement is desired, it can be clamped and then turned gradually around the interior spindle by the tangent screw, until the slit of the sight or the intersection of the wires is made to bisect the object with accuracy.

No. 240.

No. 241.

For more convenient leveling **LEVELING-ADOPTER.** of the Compass, as well as other instruments, we make the appliance

shown in No. 241, which is screwed to the top of the tripod like the ordinary leveling-head.

This can be used either with a simple ball-spindle, or with the compound ball with tangent screw, as shown in the cut.

The instrument is made approximately level upon the ball, and finally made truly horizontal by the leveling-screws.

The price of the leveling-adopter, without tripod or ball-spindle, is \$7.00; with tripod and compound tangent ball, as shown, \$19.00.

We also make for use with Surveyors' Compasses and Vernier Transit-
LEVELING-HEAD. Compasses a leveling-head, consisting of upper and lower plates, four leveling-screws and clamp and tangent movement. (See Price-List, Nos. 176 and 242.)

This leveling-head furnishes a very stable support for the instrument, while affording the same conveniences for leveling and accurate adjustment in azimuth as the leveling-heads on the more expensive instruments.

NOS. 176 AND 242.
LEVELING-HEAD.

The price complete with tripod, and fitted to the socket of the Compass or Vernier Transit, is \$18.00, or without the tripod, \$13.00.

THE TELESCOPIC SIGHT.

We have for years applied to the sight-vanes of Compasses a telescope which can be put on and removed at will. This attachment has met with approval, hundreds being now in use in all parts of the country.

This telescope is furnished with the usual cross-wires, and is attached to a movable band which, as shown in the cut, can be slipped over the sight of a Compass, clamped at any point desired, and put in adjustment by any person who has a screw-driver and a steel adjusting-pin. To put this attachment in place, slip the band over the south sight of the Compass, having the telescope at the right-hand and the clamp-screw on the outer surface of the sight; and place the band as low as will allow the telescope to revolve in either direction without striking the Compass. This place should be marked by a line across the sight, or by a screw or pin on the inner surface of the sight, that the band may set at the same point in subsequent use.

Price of Telescope No. 261 as shown, with movable band for attaching, \$17.00.

To fasten the band to the sight, first bring up the clamp-screw with a pressure just sufficient to hold the band to its place, then tighten the screw on the left until the band is against the right edge of the sight, and finally tighten the clamp-screw when the fastening will be complete

To put the telescope in focus, turn the end of the eyepiece back or forth by the thumb and forefinger until by the spiral motion of the tube the cross-wires are brought into distinct view ; the object-glass is then moved in either direction by the pinion on the side of the telescope until the object is clearly seen.

To make the adjustments, and indeed to do any correct work with a Compass, the spindle

ADJUSTMENTS. should be well-fitted and the level-bubbles should remain in the middle when the instrument is turned upon its spindle ; the sights should also trace a vertical line when the Compass is level.

The means of effecting the adjustments will be understood by the engraving on page 124 and the outline cut here given, the former showing the rear, and the latter the front view of the band to which the telescope is attached.

To make the telescope axis horizontal, the Compass being in good order, first bring the levels into the middle ;

TELESCOPE place the band in position upon the sight, as
AXIS. before described ; bring the telescope into focus and set the vertical cross-wire on the edge of a building, distant from fifty to sixty feet, and at a point near the

ground ; clamp the Compass to the spindle, and raise the telescope to the top of the building. If the wire strikes to the right of the edge, it shows that the right end of the telescope axis is the lowest.

To raise it, loosen the screws, B B, C C, which confine the piece containing the spindle of the telescope, and by the screws, D D, the lower of which should be unscrewed and the upper one tightened, raise the telescope until the wire will follow the vertical line.

If the cross-wire strikes to the left when the telescope is raised, proceed exactly the reverse in making the correction, until the wire will follow the edge from one end to the other, when the adjustment will be complete. If the vertical cross-wire is not parallel with the edge, loosen the capstan-head screws, and turn the ring by the screw heads until the correction is made ; and finally tighten the screws.

To make the second adjustment, that is, to bring the line of collimation into a position at right angles with the axis of the telescope so that the cross-wires will indicate two points in opposite directions in the same straight line, proceed as described on pages 19-21.

Find or place two objects, one on each side of the Compass, and from three hundred to four hundred feet distant from it, which the sight-vanes will intersect. Clamp to the spindle and sight through the telescope at either of the objects ; if the vertical wire strikes to the right, loosen the screws, B B, and screw up those in front, marked F F, the ends only of which are shown in the figure, until the vertical wire bisects the object, looking again through the vanes to see that the same object is seen through both telescope and sights. If, however, the

cross-wire should strike to the left of the object, proceed in a manner exactly the reverse until the error is corrected.

This adjustment is always made by us before the attachment leaves our hands, and need not be disturbed except in case of accident or careless interference with the cross-wire screws; but it can be easily made by any surveyor in a few moments and with very little practice.

When the adjustments are complete, the attachment can be put in place on the sight, and removed and replaced again in a moment, without danger of derangement in any of its parts.

The advantage of the telescope over the ordinary sight-vanes will be apparent to every one who has ever seen them compared, or who has given the matter a moment's reflection.

Much longer sights can be taken, either fore or back, and lines run up and down steep hillsides with the same facility as on level ground, and with more accuracy and with inexpressible relief to the eyes of the surveyor, so often severely strained by the use of the sight-vanes of the ordinary Compass. Indeed it may be said that with this simple attachment every Compass can be transformed into a Transit-Compass at will, and thus all the advantages of the telescope brought within the reach of every surveyor, at comparatively trifling cost.

The optical axis of the Telescopic Sight is at one side of the line of sight of the sight-vanes, but parallel with it. The difference between a sight taken
OPTICAL AXIS. with the sight-vanes and one taken with the telescope is, at a distance of two hundred feet, about two minutes; so small that it may be disregarded in any survey made with the magnetic needle. If *all* the lines are run with the Telescopic Sight, the angles measured will be accurate, as even this slight difference is entirely eliminated.

When desired, the Telescopic Sight can be mounted upon an offset-standard with counterpoise, and so arranged that the line of sight is in line with the zeros of the compass-circle.

When in use, this standard, with the telescope attached to it, is substituted for the south sight of the Compass.

The extra cost of this offset-standard with counterpoise is \$7.50.

When furnished with a new instrument the telescope is packed in the box with the Compass, or it can be safely forwarded by mail to any part of the country, securely packed in a suitable case in which it may be kept when not in use

Telescope No. 262 with level, and
clamp and tangent.

Price, as shown, \$30.00.

We make three styles of the
SIZES AND POWER. Telescopic Sight, numbered 260, 261, and 262 in the price-list.

In No. 260, the telescope is about nine inches long, is fitted with plain cross-wires, and has a power of twelve diameters.

Nos. 261 and 262 have a power of eighteen to twenty diameters, and the telescopes are about nine inches long ; but the telescope of No. 262 has a greater diameter, allowing the insertion of stadia wires, in addition to the ordinary cross-wires used in the other telescopes

The extras of vertical circle three inches in diameter and reading to five minutes, level on telescope with graduated vial, and clamp and tangent to axis,
EXTRA ATTACHMENTS. may be used with either of these Telescopic Sights. Whenever the level is used, it is necessary that the clamp and tangent to axis be added.

In the cut on page 128 the Telescope No. 262 is shown fitted with a level and clamp and tangent. For simple sighting the level and circle can, of course, be dispensed with, but in the use of the stadia wires the tangent movement is very desirable.

When measurements are to be recorded in chains and links, the stadia wires should be made to cover one foot at a distance of sixty-six feet ; if recorded in feet, the wires should cover one foot at a distance of one hundred feet.

The rod used with the stadia should be graduated to feet and decimals of a foot and provided with two targets, one being fixed at some definite point, while the other one can be moved as the surveyor requires, the distance between the two targets being accurately read off by the vernier of the movable one ; or a self-reading rod, as

described on pages 188 and 190, may be used without target for short distances.

In using the stadia, the upper wire is brought by the tangent screw precisely upon the upper or stationary target, while the lower target is moved up or down until the lower wire exactly bisects its center line, when the rod is read and the distance recorded.

PRICES OF TELESCOPIC SIGHTS AND ATTACHMENTS.

No.		PRICE.	Post.
260.	Nine-inch Achromatic Telescope, power about 12 diameters.....	\$15.00	\$0.45
261.	Nine-inch Achromatic Telescope, larger diameter of object-glass and power about 20 diameters.....	17.00	.45
262.	Same Telescope as No. 261, but furnished with stadia wires for measuring distances.....	20.00	.50

We add to new Telescopic Sights the following extras, at prices annexed.

265.	Vertical Circle with vernier to five minutes.....	\$5.00	
266.	Level on Telescope.....	5.00	
267.	Clamp and Tangent to Telescope axis.....	5.00	
268.	Offset-Standard with Counterpoise, to bring the Telescope over the line of zeros.....	7.50	\$0.50

We cannot attach the extras, Nos. 265, 266 and 267, to old telescopes, but we will furnish new Telescopic Sights fitted with these attachments and will take the old telescopes in exchange at a fair price.

SMALLER FIELD-INSTRUMENTS.

POCKET SOLAR COMPASS.

POCKET RAILROAD COMPASS.

POCKET VERNIER COMPASS. '

POCKET PLAIN COMPASS.

GEOLOGISTS' COMPASS.

CLINOMETER COMPASS.

MINERS' DIP-NEEDLE COMPASS.

DIAL COMPASS.

POCKET-COMPASSES.

WE MANUFACTURE a variety of small instruments so portable and yet so efficient that they are often used, in preference to the larger ones, for preliminary or reconnoissance work.

THE POCKET SOLAR COMPASS.

No. 276.

Price as shown, with tripod, \$105.00.

The Pocket Solar Compass has a needle three inches long and a limb four and one-half inches in diameter, graduated to half degrees, figured one row 0 to 180 each way, and reading, by its one double vernier, to single minutes.

The arrangement of the plates is similar to that of the large Solar Compass, the lower plate carrying the sights **PLATES AND SIGHTS.** revolving around the upper or compass-plate, to which are attached the solar apparatus, levels, etc. There is a clamp and tangent movement to the horizontal limb and another to the whole instrument about its spindle, both now made with an opposing spring

The distance between the sights is nearly seven inches; the sights themselves are about four and one-half inches high and have a slit and hair in half their height; they are hinged so as to fold down in packing.

The compass-circle is arranged with a pinion and is movable, so as to set off the variation of the needle to five minutes; the needle has a lifting lever by which it is raised against the glass.

The solar apparatus is attached to the upper plate, and consists of the usual *hour*, *latitude* and *declination* arcs, marked respectively A, C and B in the **SOLAR PARTS.** cut, and with an arm, F F, to the last named, carrying the solar lenses and lines.

The latitude arc is graduated to half **LATITUDE ARC.** degrees, and reads by its vernier to five minutes

The declination arc is graduated to **DECLINATION ARC.** quarter degrees, and reads by its vernier to single minutes.

The hour arc is graduated on its inner edge into hours and twelfths, or spaces of five minutes of time, the index on the declination arc above easily enabling one to read single

minutes of time The hour-arc is made movable upon its supporting segment to either side, its outer edge being also graduated on the middle portion to spaces of

HOURL-ARC. five minutes of time, and read by a vernier upon the segment to single minutes. In this way the *equation of time* for any given day is set off at once, and the time given by the index of the hour-arc thus made to agree with mean time, or that given by the ordinary clock.

The solar lenses and lines are placed as in the larger instruments, the declination arc being also reversible as the sun changes from north to south of the equator.

When packed in the case, the declination arc with its arm is detached from the hour-arc, and this itself, together with the latitude arc, folds close to the compass-box.

The Pocket Solar Compass is used either upon a ball-spindle with staff mountings, or as shown, upon a light tripod like the other Pocket-Compasses, and often with small leveling-head with clamp and tangent screws.

Sometimes a side telescope with counterpoise is used in addition to the sight-vanes.

The adjustments and use of the Pocket Solar Compass are substantially the same as those of the large Solar Com-

ADJUSTMENTS. pass already described, and its indications are so accurate that it will give the true meridian within an error of one minute, which, taken in connection with the deflection of the magnetic needle, will indicate with certainty the presence and direction of veins of magnetic iron ore.

We have the assurance of competent surveyors that, while it is much more portable, it is also very nearly as accurate as the large Solar Compass. Its weight, without box or tripod, is four and three-quarter pounds.

**NO. 285.**

Price as shown, with tripod, \$45.00.

POCKET RAILROAD COMPASS.

The instrument shown is a single vernier Railroad Compass in miniature. The limb is five inches in diameter, graduated to half degrees, figured one row 0 to 180 each way, and reads by vernier to single minutes. The needle is three and one-half inches long, and its variation can be set off to single minutes.

This instrument has the improved spring tangent, and the vernier placed at an angle of thirty degrees with the sights. The sights are made to fold down closely for convenience in packing, and are each made half slit and half hair, so that fore and back-sights may be taken without turning the instrument.

The Pocket Railroad Compass can be used for a great variety of work and, with light extension tripod, is especially adapted for surveys of mines, where angles must be taken independently of the needle.

The price, with staff mountings, is \$40, with light tripod \$45, and with extension tripod \$50.

POCKET RAILROAD COMPASS WITH TELESCOPE.

In the cut on page 137 we show a form of the Pocket Railroad Compass which is adapted to receive the Telescopic Sight.

The plates are circular and the sights are made half slit and half hair, and are jointed so as to fold down close to the glass. The needle is four and one-half inches long, and there is an arc with vernier, on the outside of the compass-plate, for setting off the variation of the needle.

The instrument has a limb about four inches in diameter, placed inside the compass-circle, and reading to single minutes by a vernier. A clamp and tangent movement is added to the spindle.

The sights being inclined to each other, as shown, a short standard supporting the telescope is secured by two milled head screws to the tops of the sights, and thus a telescope is placed in position, making the instrument in effect a very light Surveyor's Transit.

The attachments of vertical circle, level and clamp and tangent, as shown in the figure, may also be added, and

No. 293.

Price as shown, \$83.00.

thus the means furnished for taking grades and running levels with accuracy sufficient for the common practice of the surveyor.

The sights are placed to one side of the line of zeros, and the telescope is thus brought into that line and over the center of the instrument.

The short standard can be detached with the telescope and placed in the case, or replaced, in a few moments' time without deranging any of the adjustments.

The Pocket Railroad Compass can be used either on a staff or with small tripod, and, if desired, with small leveling-head, as shown.

WEIGHT OF THE POCKET RAILROAD COMPASSES, including the brass mountings of the staff, but without tripod :

No. 300 — Price as shown, $3\frac{1}{2}$ -inch needle, with tripod, \$21.00.

No. 305 — With $4\frac{1}{2}$ -inch needle, and tripod, \$23.00.

POCKET VERNIER COMPASS.

The Pocket Vernier Compass is an excellent and portable instrument for preliminary work, having a fine needle and a vernier and clamping nut, by which the sights can be placed at an angle with the line of zeros, so as to set off the variation of the needle as with the Vernier Compass.

The instrument has folding sights, two levels and staff mountings, and is packed in a mahogany case.

The sights in the three and one-half inch Compass are made, as shown in the cut, with a slit in the south vane and a hair in the north vane for readily finding the object ; but in the four and one-half inch Compass the sights are made with half slit and half hair, as shown on page 135.

They also fold down to the Compass when it is packed in the case. The Compass is furnished with staff mountings, and is often used with a light tripod

When desired to set off the variation more readily, a rack movement with pinion is supplied at an extra cost of \$4 00

We make two sizes of the Pocket Vernier Compass, having needles respectively three and one-half and four and one-half inches long; both have
SIZE AND WEIGHT. the compass-circle graduated to half degrees. In the smaller size the variation vernier reads to five minutes, and in the larger size to single minutes.

Compass with $3\frac{1}{2}$ -inch needle weighs about $1\frac{3}{4}$ lbs.
 " " $4\frac{1}{2}$ " " " " $2\frac{3}{4}$ "

POCKET VERNIER COMPASS WITH TELESCOPE.

The arrangement for attaching a telescope and extras to the sights of the four and one-half-inch Pocket Vernier Compass is shown on page 141, making this little instrument a Transit-Compass for ordinary land-surveying and reconnoissance, with power to give levels and grades with accuracy sufficient for ordinary practice. The sights in such an arrangement are placed at one side, that the telescope may be directly over the center, and the instrument should have a clamp and tangent movement for the spindle, as shown in the figure. When packed for transportation, the telescope and support are detached from the sights and packed separately in the case. Staff mountings are always furnished with these Compasses; and a light tripod, as shown, is very generally added.

WEIGHT. The weight of Compass No. 312 without tripod is about four and one-half pounds; the tripod weighs about four pounds

LEVELING- passes Nos. 275 to 319,
ADOPTER. giving in connection with the ball a rapid and accurate means of leveling any of the smaller instruments. The attachment weighs less than one pound, and can be used on the tripod by merely removing the brass cap. Its value and use are apparent upon inspection. Price, \$5.00.

GEOLOGISTS' COMPASS.

**NO. 335.**

Price, as shown, \$24.00.

We show here a popular instrument for topographical work, known as the Geologists' Compass. It is made of aluminum to diminish its weight, and has a needle two and five-eighths inches long enclosed with its compass-circle in a circular box set upon a base four inches square, the edges of which are beveled and graduated, two of them for a tangent scale and the other two with scales of eighths and tenths of inches. The compass-circle is made movable and, by a vernier attached to it on the inside, the variation of the needle can be set off to five minutes. On the south side of the compass-face is an arc of one hundred and

eighty degrees, figured on each side of the zero line from 0 to 90. The index point, a little pendulum hung from the center-pin, indicates on this arc the angle of slope when the Compass is placed so that it rests on its south edge. On the outside of the circular box containing the compass-circle is a movable circle, beveled and graduated on its upper edge and figured from 0 to 90, and having at each quadrant a slit cut for sighting. Two folding sights are attached to the edge of the circular box. The Compass is supported on a simple ball-spindle and socket with staff mountings, and is packed in a mahogany box.

CLINOMETER COMPASS.**NO. 338.**

Price, as shown, \$16. (See page 145.)

CLINOMETER COMPASS.

Another form of Pocket-Compass is shown on page 144. It is made of brass, and is known as the Clinometer Compass. It has a needle three and one-half inches long, enclosed with its compass-circle in a circular box set upon a base four and one-half inches square. On one edge of this base is placed the rectangular side upon which the Compass may be set in determining grades.

The small pendulum swinging from the center-pin designates, by its index, the degree of slope upon the graduated arc on the compass-face. Two folding sights are attached to the circular box, and two small levels are placed at right angles with each other upon the base. The Compass is supported upon a simple ball-spindle and socket, with staff mountings, and is packed in a mahogany box.

MINERS' OR DIP-COMPASS.

The Dip-Compasses, two forms of which are shown on this page, consist essentially of a magnetic needle so suspended as to move readily in a vertical direction, the angle of inclination, or "dip," being measured upon the graduated rim of the compass-circle.

When in use, the ring or bail is held by the hand, and the compass-box by its own weight takes a vertical position. It must also be held in the plane of the magnetic meridian.

NOS. 340 AND 341.
Price, \$12.00.

NOS. 344 AND 345.
Price, \$12.00 and \$15.00.

In this position, the needle, when unaffected by the attraction of iron, assumes a horizontal line, as shown by the zeros of the circle. When brought over any mass of magnetic iron ore it dips, and thus detects the presence of such ore with certainty.

If the Miners' Compass, No. 340 or 341, is held horizontal it serves as an ordinary Pocket-Compass, and thus indicates the magnetic meridian, in the plane of which it should be held when used to ascertain the dip.

Several different styles of this instrument are made. Those shown as Nos. 340 and 341, with a three-inch needle, have the two sides of glass, and are provided with a stop for the needle which is worked by the little brass knob between the ends of the ring.

THE NORWEGIAN COMPASS, Nos. 344 and 345, is a modification of an instrument used in northern Europe.

It has a needle either three or four inches long, resting upon a single vertical pivot so as to move freely in a horizontal direction. At the same time, being attached to the needle-cap by two delicate pivots, one on each side, it is free to dip like the needle of the ordinary Miners' Compass.

PRICES.

No.		PRICE.	POST.
340.	Miners' Compass, 3-inch needle, glass on both sides, wood box, stop to needle.....	\$12.00	\$0.25
341.	Miners' Compass, 3-inch needle, glass on both sides, brass covers, stop to needle..	12.00	.35

345.	Same as No. 344, but with 4-inch needle.....	15.00	.50

NOTE.—No instrument made that will indicate the presence of gold or silver.

BRASS DIAL COMPASS.

**No. 348.**

Price, \$18.00.

This little instrument has a needle two and five-eighths inches long, and with its compass-circle is enclosed in a circular box set upon a base four inches square, three edges of which are chamfered and graduated, the one on the W-side of the Compass into inches and tenths and the two others into degrees and half degrees, and figured from a center on the south-west corner of the base.

The compass-circle is movable, in order to set off the variation of the needle, and has a vernier attached to it on the inside, reading a graduated arc on the face of the Compass to five minutes.

There is also on the south side of the face an arc of one hundred and eighty degrees, figured from 0 to 90 on each side of the south or zero-line of the face.

A pendulum with index-point hung from the center-pin reads this arc when the compass is set up vertical on the raised south edge, thus making it a clinometer or slope-measurer.

The sight is hinged so as to fold in packing, but when erect makes taut a fine silk thread, attached at one end to the sight and at the other to an hour-circle above the compass-glass, at an angle with the plane of the hour-circle equal to that of the latitude of the place where the Compass is used. The hour-circle is graduated for any required latitude, as a sun-dial, the thread serving as a gnomon to give apparent time with the sun.

The Dial Compass is extensively used in this country in regions where there is local attraction, and it is desirable to have a simple means of determining the meridian independently of the needle.

This can be easily and quickly done by turning the Compass, with dial graduated for the latitude of the place, until the shadow of the thread when the Compass is held level indicates local time on the dial. The line of zeros will then be in the meridian.

The needle may then be set to the meridian by laying off the variation, and any deflection of the needle from the true meridian will indicate the presence of veins of magnetic iron ore.

Extra hour-circles, graduated for any latitude and to fit the same Compass, can be furnished at an extra cost of \$5.00 each.

Staff mountings, including ball-spindle and socket, can also be furnished at an extra cost of \$2.50.

ALUMINUM DIAL COMPASS.

**No. 350.**

Price, as shown, \$30.00

The illustration shows an improved form of the Dial Compass, made of aluminum, and differing from our usual pattern in several respects. This new instrument is of the same size and has the same parts as the Dial Compass, shown on page 148, and in addition has a movable circle graduated on its beveled edge from zero to ninety degrees. At each quadrant there is a slit cut for sighting, and an open sight is furnished with the Compass, to be placed upon the clinometer base when desired, and used in conjunction with the regular sight. The instrument is mounted upon a small ball-spindle and socket with staff mountings, and is packed in a mahogany box.

LEVELING-INSTRUMENTS.

ENGINEERS' Y-LEVELS.

ARCHITECTS' Y-LEVELS.

DRAINAGE LEVELS.

ENGINEERS' Y-LEVELS.

OF THE different varieties of Leveling-Instruments, the Y-Level is universally preferred by American Engineers on account of its easy adjustment and superior accuracy.

Of these levels we manufacture five different sizes, having telescopes twenty-two, twenty, eighteen, fifteen, and twelve inches in length. The cut on page 153 represents our twenty-inch Y-Level.

The Telescope has near its end two rings of bell-metal, turned very truly and of exactly the same diameter

TELESCOPE. On these rings it rotates in the Ys, or it can be clamped, when the clips of the Ys are brought down upon the rings, by pushing in the tapering pins.

The Telescope has a rack and pinion movement to both object-glass and eyepiece, and an adjustment for centering the eyepiece, shown at A A in the sectional view of the instrument, page 154, and another, seen at C, for insuring the accurate projection of the object-glass slide.

Both of these are completely concealed from observation and disturbance by thin bands which screw over them.

The Telescope has also a shade over the object-glass, so made that, while it may be readily moved on its slide over the glass, it cannot be dropped off and lost.

A dust-guard to the object-glass slide is now furnished free of charge with the 18, 20, and 22-inch Y-Levels.

A small Compass, without sights and with three-inch needle, is sometimes attached to the telescope
COMPASS. and used to obtain the bearing of lines; its extra cost is \$10 00.

No. 376.

20-INCH Y-LEVEL.

Price as shown, including Tripod, \$110.00.

SECTIONAL VIEW OF Y-LEVEL.

A Horizontal Circle, three and one-half inches in diameter, can be fitted to the leveling-head of the Y-Level.

HORIZONTAL CIRCLE. The circle is graduated to whole degrees, and is read by vernier to five minutes. The extra cost for this attachment is \$15.00.

The interior construction of the telescope will be readily understood from the sectional cut, page 154, which exhibits the adjustment that insures the accurate projection of the object-glass slide.

This is peculiar to our instruments, and is always made so permanently as to need no further attention at the hands of the engineer.

The necessity for such an adjustment will appear when we state that it is almost impossible to make a telescope tube a perfectly straight cylinder on its inner surface.

Such being the case, it is evident that the object-glass slide which is fitted to this surface, and moves in it, must partake of its irregularity, so that the glass and the line of collimation depending upon it, though adjusted in one position of the slide, will be thrown out when the slide is moved out or in.

To prove this, let any Level be selected, which is constructed in the usual manner, and the line of collimation adjustment upon an object taken as near as the range of the slide will allow; then let another be selected as distant as may be clearly seen; upon this rotate the wires and they will generally be found out of adjustment, sometimes to a degree fatal to any confidence in the accuracy of the instrument. The arrangement adopted by us to correct this imperfection, and which perfectly accomplishes its purpose, is shown in the sectional cut.

Here are seen the two bearings of the object-glass slide, one being in the narrow ring slightly less than the

diameter of the main tube, the other in the small adjustable ring, shown at C, and suspended by four screws in the middle of the telescope.

Advantage is here taken of the fact that the rays of light are converged by the object-glass, so that none are obstructed by the contraction of the slide except those which diverge and which ought always to be intercepted and absorbed in the blackened surface of the interior of the slide.

Now, in such a telescope, the perfection of movement of the slide depends entirely upon its exterior surfaces at the points of the two bearings. These surfaces are accurately turned, concentric and parallel with each other, and, being fitted to the rings, it is only necessary to adjust the position of the smaller ring so that its center will coincide with that of the optical axis of the object-glass. When this has been done no further correction will be necessary unless the telescope should be seriously injured. The manner in which the adjustment of the object-glass slide is effected will be considered when we come to speak of the other adjustments

RACK AND PINION.

As seen in the cut, the telescopes of our eighteen, twenty, and twenty-two inch Levels are furnished with rack and pinion movement to both object-glass and eyepiece.

The advantages of an eyepiece pinion are that the eyepiece can be shifted without danger of disturbing the telescope, and that the wires are more certainly brought into distinct view, so as to avoid any error of observation arising from the instrumental parallax.

The level-tube, with ground vial and a scale, is attached to the under side of the telescope, and furnished at different ends with the usual movements in both horizontal and vertical directions.

LEVEL-VIAL.

The aperture of the tube, through which the glass vial is seen, is about five and one-quarter inches long, and is crossed at the middle by a rib or bridge which greatly strengthens the tube.

The level-vial is made of glass tube, selected so as to have an even bore from end to end, and finely ground on its interior surface, so that the run of the air-bubble may be uniform throughout its whole range. The level-scale which extends over the whole length is graduated to tenths of an inch and figured at every fifth division, counting from zero at the middle of the bridge. The scale is set close to the glass.

The sensitiveness of a ground level is best determined by an instrument called a level-tester, consisting of a bar with two Ys to hold the level-tube, and pivoted at one end, while at the other end is a micrometer wheel attached to the top of a fine-threaded screw which raises the end of the tester very gradually. The number of divisions passed over on the perimeter of the wheel, in carrying the bubble over a tenth of an inch on the scale, is the index of the delicacy of the level. In the tester which we use, a movement of ten divisions of the wheel to one of the scale indicates the degree of delicacy generally preferred for railroad engineering. For canal work a more sensitive bubble is often required, as, for instance, one of five to seven divisions of the wheel to one of the scale.

The Ys of our levels are made large and strong, of the best bell-metal, and each have two nuts adjustable with the ordinary steel pin. The clips are brought
YS. down on the rings of the telescope tube by the Y-pins, which are made tapering, so as to clamp the rings firmly. The clip of one of the Ys has a little pin pro-

jecting from it, which, entering a recess in the edge of the ring, insures the horizontal position of the cross-wire.

The level-bar is made round, of the best bell-metal, and shaped for greatest strength in the parts
LEVEL-BAR. most liable to sudden strains. Connected with the level-bar is the head of the leveling-socket.

The socket is compound ; the inner spindle, D (see page 154). upon which the whole instrument is supported, is made of steel and nicely ground so as to turn
SOCKET. evenly and firmly in a hollow cylinder of bell-metal ; this again has its exterior surface fitted and ground to the main socket, E E, of the leveling-head.

The bronze cylinder is held upon the spindle by a washer and screw, the head of the latter having a hole in its center through which the string of the plummet is passed.

The upper part of the instrument, with the socket, may be detached from the leveling-head ; and this also, as is the case with all our instruments, can be unscrewed from the tripod head ; but all the Y-Levels made by us are packed in the case complete with leveling-head, experience having shown that there is thus less danger of injury in transportation. It will be seen from the cut that the arrangement just described allows long sockets and yet brings the whole instrument down as closely as possible to the leveling-head, both objects of great importance in the construction of any instrument.

The leveling-head has the same plates and leveling-
LEVELING- screws as described in the account of the
HEAD. Engineers' Transit. (See page 17.) The tangent screw has also an opposing spring as there described.

For the fifteen-inch level we make a leveling-head similar to that used with the lighter Engineers' Transit.

THE ADJUSTMENTS.

The adjustment of the object-glass slide is peculiar to our instruments, and is always made by us so permanently as to need no further attention at the hands of the engineer, unless in case of derangement by accident.

To adjust the object-glass slide, the maker selects an object as distant as may be distinctly observed, and upon **OBJECT-GLASS SLIDE.** it adjusts the line of collimation, in the manner described on page 161, making the center of the wires to rotate without passing either above or below the point or line assumed.

In this position, the slide will be drawn in nearly as far as the telescope tube will allow.

With the pinion-head he then moves out the slide until an object, distant about ten or fifteen feet, is brought clearly into view ; again rotating the telescope in the Ys he observes whether the wires will reverse upon this second object.

Should this happen to be the case, he will assume that as the line of collimation is in adjustment for these two distances, it will be so for all intermediate ones, since the bearings of the slide are supposed to be true and their surfaces parallel with each other.

If, however, as is most probable, either or both wires fail to reverse upon the second point, he must then, by estimation, remove half the error by the screws at C (page 154), at right angles with the wire sought to be corrected, remembering at the same time that, on account of the inverting power of the eyepiece, he must move the slide in the direction which apparently increases the error. When both wires in succession have been thus treated, the line of collimation is adjusted on the near object, and the tele-

scope again brought upon the most distant point ; here the tube is again rotated, the reversion of the wires upon the object once more tested, and the correction, if necessary, made in the same manner

He proceeds thus until the wires will reverse upon both objects in succession ; the line of collimation will then be in adjustment at these and all intermediate points, and by bringing the screw-heads, in the course of the operation, to a firm bearing upon the washers beneath them, the adjustable ring will be fastened so as to need no further adjustment for many years.

When this has been completed the thin brass ferule is screwed over the outside ring, concealing the screw-heads and avoiding the danger of their disturbance by an inexperienced operator.

In making this adjustment, it is always best to bring the wires into the center of the field of view by moving the screws, A A, (page 154,) working in the centering-ring of the eyepiece tube

Should the engineer desire to make the adjustment of the object-glass slide, it will be necessary to remove the level-tube, in order that the screw immediately above its scale may be operated upon with the screw-driver.

The adjustments which are common to all Y-Levels, and with which the engineer should be familiar, are :

1. To adjust the line of collimation, or, in other words, to bring the cross-wires into the longitudinal axis, so that their point of intersection will remain on any given point during an entire rotation of the telescope.

2. To bring the level-bubble parallel with the bearings of the Y-rings or with the longitudinal axis of the telescope.

3. To adjust the Ys, or to bring the bubble into a position at right angles with the vertical axis of the instrument.

To adjust the line of collimation, set the tripod firmly, remove the Y-pins from the clips so as to allow the telescope to turn freely, clamp the instrument **LINE OF COLLIMATION.** to the leveling-head, and by the leveling and tangent screws bring either of the wires upon the clearly marked edge of some object, distant from one hundred to five hundred feet. Then with the hand carefully rotate the telescope half-way around, so that the position of the same wire is compared with the object selected.

Should it be found above or below, bring it half-way back by the capstan-head screws at right angles with it, always remembering the inverting property of the eyepiece; now bring the wire again upon the object and repeat the first operation until it will reverse correctly. Proceed in the same manner with the other wire until the adjustment is completed.

Should both wires be much out, it will be well to bring both nearly correct before either is entirely adjusted.

When this is effected, unscrew the covering of the eyepiece centering-screws, shown in the sectional view at A A, page 152, and move each pair in succession with a screw-driver until the wires are brought into the center of the field of view. The inverting property of the eyepiece does not affect this operation, and the screws are moved directly.

To test the correctness of the centering, rotate the telescope, and observe whether it appears to shift the position of an object. Should any movement be perceived, the centering is not perfectly effected. In all telescopes the line of collimation depends upon the relation of the cross-wires and

object-glass ; and therefore the movement of the eyepiece does not affect the adjustment of the wires in any respect.

When the centering has once been effected it remains permanent, the cover being screwed on again to conceal and protect it from derangement at the hands of the curious and inexperienced operator.

To adjust the level-bubble, clamp the **LEVEL-VIAL.** instrument over either pair of leveling-screws, and bring the bubble into the middle of the tube.

Now turn the telescope in the Ys, so as to bring the level-tube to one side of the middle of the bar. Should the bubble run to the end, it would show that the vertical plane passing through the middle of the bubble was not parallel to that drawn through the axis of the telescope rings.

To correct the error, bring the bubble, by estimation, half-way back with the capstan-head screws on each side of the level-holder, placed usually at the object-glass end of the tube.

Again bring the level-tube over the middle of the bar and the bubble to the middle, turn the level to either side, and, if necessary, repeat the correction until the bubble will keep its position when the tube is turned half an inch or more to either side of the middle of the bar.

The necessity for this operation arises from the fact that, when the telescope is reversed end for end in the Ys in the other and principal adjustment of the bubble, we are not certain of placing the level-tube in the same vertical plane ; and therefore it would be almost impossible to effect the adjustment without a lateral correction.

Having now, in great measure, removed the preparatory difficulties, we proceed to make the level-tube parallel with the bearings of the Y-rings.

To do this, bring the bubble into the middle with the leveling-screws, and then, without jarring the instrument, take the telescope out of the Ys and reverse it end for end. Should the bubble run to either end, lower that end, or, what is equivalent, raise the other by turning the adjusting-nuts on one end of the level until, by estimation, half the correction is made; again bring the bubble into the middle by the leveling-screws, and repeat the whole operation until the reversion can be made without causing any change in the bubble.

It would be well to test the lateral adjustment and make such correction as may be necessary in that, before the horizontal adjustment is entirely completed.

To adjust the Ys: Having made the previous adjustments, it remains now to bring the level into
Ys. position at right angles with the vertical axis, so that the bubble will remain in the middle during an entire rotation of the instrument

To do this, bring the level-tube directly over the middle of the bar and clamp the telescope in the Ys, placing it as before, over two of the leveling-screws, unclamp the socket, center the bubble, and turn the instrument half-way around, so that the level-bar may occupy the reverse position with respect to the leveling-screws beneath.

Should the bubble run to either end, bring it half-way back by the Y-nuts on either end of the bar; then move the telescope over the other set of leveling-screws; bring the bubble again into the middle, and proceed as above described, changing to each pair of screws successively until the adjustment is very nearly perfected, when it may be completed over a single pair.

The object of this approximate adjustment is to bring the upper plate of the leveling-head into a position as

nearly horizontal as possible, in order that no essential error may arise in case the level, when reversed, is not brought opposite its former position. When the level has been thus completely adjusted, if the instrument is properly made and the socket well fitted, the bubble will reverse over each pair of screws in any position.

Should the engineer be unable to make it work correctly, he should examine the outside socket carefully to see that it is set securely in the main socket, and also notice that the clamp does not bear upon the ring which it encircles.

When these are correct, and the error is still manifested, it will probably be found in the imperfection of the interior spindle.

After the adjustments of the level have been made, and the bubble remains in the middle in any position of the socket, the engineer should turn the telescope in the Ys until the pin on the clip of the Y will enter the little recess in the ring to which it is fitted, and by which is insured the horizontal position of the cross-wire.

When the pin is in its place the horizontal wire may be applied to any level line, and in case it should not be parallel with it, two of the cross-wire screws that are at right angles with each other may be loosened and, by the screws outside, the cross-wire ring turned until the wire is horizontal; the line of collimation must then be corrected again and the adjustments of the Level will be complete.

TO USE THE LEVEL.

When using the instrument, the legs of the tripod must be set firmly into the ground; the bubble should then be brought over each pair of leveling-screws successively and leveled in each position, any correction being made in the adjustments which may appear necessary.

Care should be taken to bring the wires precisely in focus, and the object distinctly in view, so that all errors of parallax may be avoided. In all instances, the wires and object should be brought into view so perfectly that the cross-wires will appear to be fastened to the surface, and will remain in that position however the eye is moved.

In running levels it is best, wherever possible, that equal fore-sights and back-sights should be taken, so as to avoid any error arising from the curvature of the earth, and also for correcting any errors of adjustment in the instrument.

If the socket of the instrument becomes so firmly set in the leveling-head as to be difficult of removal in the ordinary way, the engineer should place the palm of his hand under the Y-nuts at each end of the bar and give a sudden upward blow to the bar, taking care also to hold his hands so as to grasp it the moment it is free.

If there is any roughness in the movement of the object-glass slide, it may be looked for in three places :

1. Remove the four little screws that attach the pinion-strap to the telescope. See that the pinion turns freely in its socket ; if it does not, then there is dirt in the bearing that is cutting its surface. Remove the nut at the end of the pinion-rod and knock the pinion out of its head with a block of wood. The scratched surface can be rubbed smooth with the back of a knife-blade. Put a little tallow on the bearings and replace the parts.

2. While the pinion is out see that the slide moves freely in or out. If it scratches, rub it smooth.

3. If the pinion movement and slide are found in good order, the trouble may be found on the slide of the slot opposite the rack, on the edge which bears upon the back of the pinion-socket. Rub it smooth and apply a little tallow.

We have introduced in the object-glass slides of all our telescopes, as well as in the pinion-sockets, an anti-friction bearing which, after a trial of several years, has proved to be a complete remedy for the abrasion or fretting of the surface above mentioned.

NO. 378.

15-INCH Y-LEVEL. Price as shown, with tripod, \$90.00.

Our fifteen-inch Level, as shown, has the same arrangement of sockets, tripod, etc., as the larger Levels, but has no pinion movement to the eyepiece. The shade to the object-glass is removable. The leveling-head remains attached to the spindle, and is packed with it in the box. The instrument is also somewhat smaller and lighter than the other sizes.

SIZE AND WEIGHT. The average weight of the different sizes of our Y-Levels, exclusive of the tripod, is about as follows :

22-inch telescope, with leveling-head.....	14 $\frac{1}{2}$ lbs.
20-inch " " 	13 $\frac{1}{2}$ lbs.
18-inch " " 	13 $\frac{1}{4}$ lbs.
15-inch " " 	11 $\frac{1}{4}$ lbs.
Architects' Level, " 	6 $\frac{1}{2}$ lbs.

THE ARCHITECTS' LEVEL.

No. 380.

Price as shown, with tripod, \$50.00.

The figure represents a Level, introduced by us in 1874, which is very largely used by Architects, Builders and Millwrights, as well as by Engineers and Surveyors, in the grading of streets, drains and sewers.

The instrument has a telescope twelve inches in length, furnished with rings and Ys like the larger Levels, and adjusted in the same manner.

The leveling-head has the ordinary screws and clamp to the spindle, but no tangent movement ; it has also a horizontal circle three inches in diameter, fitted to the upper end of the socket and turning readily upon it ; the circle is graduated to degrees, figured from 0 to 90 each way, and is read to five minutes by a vernier which is fixed to the spindle.

The telescope is directed to any object by hand, the spindle turning readily in its socket ; but it can be clamped in any position by the clamp-screw shown under the circle.

The instrument is placed either upon a light tripod as shown, or on a small triangular plate, called a "trivet," having three sharp steel points by which it is firmly set upon any surface of wood or stone ; both tripod and trivet are furnished with the Level. A short piece of tube called a shade is also supplied, to put on over the object-glass to protect it from the glare of the sun.

No. 381.

Price as shown, with clamp and tangent, \$65.00.

We add to the Architects' Level, when desired, a clamp and tangent movement, thus enabling the instrument to be clamped more securely, and a movement in a horizontal plane to be made more accurately. When thus fitted, the Architects' Level is sold for \$65.00.

The adjustments of the Architects' Level are made exactly as described in our account of the
ADJUSTMENTS. larger Levels. They are not liable to derangement, and will ordinarily require but little attention.

TO USE THE ARCHITECTS' LEVEL.

The instrument should be set up firmly upon the tripod or trivet, and in a position as nearly level as practicable, the telescope placed over either pair of leveling-screws, and the bubble brought into the middle by turning the opposite screws with the thumb and forefinger of each hand, the thumbs being both turned in or out as may be needed, and both screws brought to a bearing in the little cups underneath. Having brought the bubble into the middle of the vial, turn the telescope over the other pair of screws, and repeat the same operation.

The instrument having thus been carefully leveled, bring the eyepiece and object-glass into focus upon the object as before described, and the horizontal cross-wire will give any number of points required, which will all be in the same level plane.

A strip of board held erect will answer as a rod, and a line in pencil drawn across it at the part cut by the horizontal wire will give the height of the starting-point; and any different points on the rod, either above or below that indicated by the cross-wire, will show the difference in height of the various points assumed, as compared with the starting-point.

In laying off angles with the Level, the bubbles should first be brought into the middle as before described, and **LAYING OFF** the vertical cross-wire made to cut the object **ANGLES.** or line from which the angle is to be taken. Then, the spindle being clamped by the little milled head screw under the circle, the circle is turned around by hand until the zero-lines of both circle and vernier are made to coincide; then loosen the clamp-screw, turn the telescope to the point desired, and the angle between the two points will be read off on the circle.

The point underneath the Level is easily indicated by the point of the plummet suspended from the tripod.

It will be understood that, by the use of the vernier, angles can be read on the circle to five minutes, but ordinarily only even angles will be taken and only the middle line of the vernier will be used.

In many situations, after the walls of a building have been carried up to any required height, it becomes difficult

to set up the tripod, and in this case the level is screwed upon the trivet, which can be set upon the wall or a piece of board tacked to the building, or indeed upon any surface nearly level and not less than six inches square.

To illustrate the value of this instrument in laying out the sites of buildings, suppose it is desired to erect a building, C D, at right angles with a building, A B, and at a given distance from its front.

First set up the Level at E, and carefully center the bubble, the point of the plummet below indicating the required distance of the side of the

new building from the front, A B. Measure the same distance at the other corner of A B, and, having erected the rod, sight upon it with the telescope and clamp to the spindle.

Now carry the rod the required distance from B, and move it from side to side until it is again in line with the telescope, as at C.

Remove the instrument, and having carefully set it over the point, C, by the plummet and brought the bubble into the middle as before, set the telescope again upon the rod placed at E or F, and clamp to the spindle. Bring the zeros of the circle and vernier to coincide, unclamp, and turn the vernier to ninety degrees; this will give a point, D, at any required distance from C, and C D will be the side of the proposed building. The side, C G, is determined by turning the telescope around until the vernier is in line with the other zero of the circle, and thus the corner, C, and the two sides, C D and C G, are at once set off, and the remaining corner, H, easily ascertained by making D H and G H equal to C G and C D respectively.

Other uses of the level, as the setting of floor-timbers, of window and door-sills, the leveling of floors, etc., will readily occur to one who has been engaged in building, where it is of great advantage.

To the millwright such a Level is almost indispensable in the aligning and leveling of shafting, the ascertaining of the fall of water obtainable, and in determining the overflow of land by a mill-pond.

The farmer will find it of value in laying out drains, determining their location, ascertaining the height of springs, and similar work.

This Level has become widely known, and its extreme cheapness, simplicity and excellence have created a great demand for it.

**No. 387.**

Price as shown, \$25.00.

THE DRAINAGE LEVEL. (New Pattern.)

Figure No. 387 represents a Level combining the extremes of simplicity and compactness with real efficiency, and at a very moderate cost. The telescope is about nine inches long, and is made especially for this instrument, achromatic, of low but sufficient power, and good light and definition. The cross-wires are fixed in the eyepiece so that they are not easily disturbed. The level, telescope and socket are enclosed and secured in a strong outside case of brass, about seven and one-half inches long, two and one-quarter inches wide, and one and one-half inches high.

The ends of the case are thickened and made parallel each to each, on the upper and under sides.

A ball attachment screws into a spindle that is within the case, and by which it is made approximately level, and then precisely so by the leveling-screws as shown.

When desired, the leveling-head can be dispensed with, and the instrument leveled by the ball alone.

A Compass with three-inch needle is added to the Drainage Level, when desired. This is fitted securely to the upper surface of the case and can be removed at pleasure ; and while it does not interfere in any way with the reading of the level-vial, it furnishes a ready means of determining the bearing of lines or of measuring angles by the needle.

This Level is adjusted almost as simply as an ordinary Masons' or Builders' Level : The spirit-level, by reversing from end to end on the lower faces of

ADJUSTMENTS. the case, and making necessary corrections by the screws at the eyepiece end, marked "L" on opposite faces and in line with the level-tube ; the telescope, by applying the opposite faces to the same surface, and bringing the telescope cross-wires by two screws marked "T," one on each face, so as to cut the same point in both positions of the case. A small block of wood, having a screw-thread that fits the top of the ball attachment, is furnished with the instrument, for use in making the above adjustments when needed. When the ball is screwed firmly to the spindle, and the instrument leveled up, it should remain level when reversed upon its spindle in any direction. If it does not, correct the error by the two screws found on the opposite sides of the case and marked "S." Should the cross-wires be indistinct or out of

focus, unscrew the cap of the eyepiece, and turn the setting of the lens around in either direction until the wires are clearly seen, when the cover may be replaced as before. To clamp the instrument on the spindle, turn the small milled-head screw at the eyepiece end.

To screw the ball attachment to the spindle, press in the spring-catch at the bottom of the case, and the ball can then be easily screwed in.

It will, of course, be understood that these adjustments are always made by the maker, and are not liable to derangement in the ordinary use of the Level.

The advantages of this Level, in the work of the farmer, manufacturer and builder, will be apparent on a simple inspection: drains can be located and leveled, the height of springs ascertained, and the accurate levels of lines of shafting, floor-timbers and sills be determined.

• The Architects' Leveling-Rods, hereafter described, are intended for use with this instrument, if desired.

TRIPODS.

IN THE tripods of all our instruments the upper part of the leg is flattened and slotted to fit closely on each side of a strong tenon projecting from the under side of the tripod head, there being also a strong brass bolt, with large head and thumb-nut on opposite sides of the leg, by which it is held firmly in place.

The tripod head is made of the best bell-metal, the tenons and upper part being cast in one piece and firmly braced together. The legs are round, and taper in each direction towards the head and point.

The point or shoe is a tapering brass ferrule, having an iron end ; it is cemented and firmly riveted to the wood.

The legs of all our tripods are made of straight-grained hardwood about four feet eight inches long from head to point. We make four sizes of tripods with solid legs, as follows :

The heavy tripod, No. 400, has a metal head four and one-quarter inches in diameter, with legs one and three-eighths inches in diameter at the top, one and three-quarters at the swell, and one and one-eighth near the point. This is used with the Engineers' Transit and with the larger Y-Levels.

The medium size tripod has a head of the same diameter as the former, and legs which are one and one-eighth inches in diameter at the top, one and five-eighths at the swell, and one and one-sixteenth near the point. This tripod is used with the Surveyors' Transit, the light Engineers' Transit, and the fifteen-inch Level.

The Compass tripod, No. 415, has a head about three inches in diameter, and legs which are about one inch in

diameter at the top, one and three-eighths at the swell, and seven-eighths near the point.

This tripod is used with the various Compasses and with the Vernier Transit Compass.

PLAIN TRIPODS.

Nos. 400 AND 430.

No. 415.

The Pocket-Compass Tripod is the same style as No. 415, but has smaller head and legs. The legs are nearly three-quarters of an inch in diameter at the top and bottom, and one and one-eighth at the swell.

SPLIT-LEG TRIPOD.

The improved split-leg tripod is shown in the engraving. The change in form is shown in section at A B.

The legs are of straight-grained hardwood, and by the new form stiffness and strength are gained with reduced weight and greater comfort in carrying. We are confident that engineers will regard these changes as great improvements.

We make several sizes of this tripod, to use with Transits, Levels, and Compasses.

NOS. 410 AND 440.

EXTENSION TRIPOD.

In No. 410 is shown a decided improvement on the old pattern of extension tripod, which has proved so popular. This new tripod is stronger, more rigid and weighs less than the old form.

The difference is shown in section at A B. The new tripod can be carried with more comfort than the old, and the shape of the side pieces allows the middle piece to be clamped firmly with the two bands and screws, while slight changes in length can be made by twisting the middle piece up or down. The legs are clamped to the tripod head with thumb-nuts.

We make several sizes of extension tripods. The large size is used with the large Transits and Levels, and the medium size with the Mountain Transit. A smaller size is used with the smaller Transits, Architects' Levels and large Compasses, and the smallest size is used with the various Pocket-Compasses.

NOTE.—For prices of plain, split-leg and extension tripods, see pages 266 and 267 of the Price-List.

LEATHER CASES AND POUCHES.

No. 490.

We have in our establishment the best facilities for making all kinds of leather work to order, and can promptly furnish anything in the line of cases or pouches for surveying-instruments.

The small pouch as shown in the cut furnishes a very convenient method for carrying small Pocket-Compasses without telescopes, as Nos. 288-350.

These pouches are strongly made, furnished with adjustable sling strap, and are so arranged as to hold the Compass and its mountings firmly and protect them from any injury in transportation. The wooden box in which the small Compasses are packed is omitted when the leather *pouch* is used. The leather *cases*, however, are fitted to hold the wooden box containing the instrument, and are used with any Transit, Level, or Compass.

NOTE.—For prices of leather cases and pouches, see page 268 of the Price-List.

We also make, to order, canvas cases for carrying tripods and leveling-rods.

LEVELING-RODS.

WE GIVE on the following pages cuts and descriptions of the leveling-rods commonly used by American engineers and surveyors, which are manufactured by us in large quantities and kept constantly in stock.

Our facilities for the manufacture of leveling-rods have for many years surpassed those of all other makers. The greatest care is exercised in the preparation and seasoning of the wood, special appliances and machinery for the work have been constructed at great cost, and in point of finish and accuracy our rods are unexcelled.

For many years we have made to order special rods, to **SPECIAL** designs furnished, which have been used in the **RODS.** most critical work with perfect satisfaction. We are prepared to make rods of any design to order.

THE PHILADELPHIA ROD.

(No. 500)

This rod is made in two parts, each about three-quarters of an inch thick by one and one-half inches wide and seven and three-tenths feet long, the parts connected by two metal sleeves, the upper one of which has a clamp-screw for fastening the two parts together when the rod is raised for a higher reading than seven feet.

Both sides of the back strip and one side of the front are recessed one-sixteenth of an inch below the edges. These surfaces are painted white, graduated into feet, tenths and hundredths of a foot, and the feet and tenths figured.

The graduations and figures are slightly impressed on the recessed surfaces, thus increasing their durability.

No. 500. PHILADELPHIA ROD, in 2 parts. Price, \$14.00.

The edges of the rod and the corners of the brass mountings are rounded, for ease in handling.

The front piece reads from the bottom upward to seven feet, the foot figures being red and the tenth figures black. When the rod is extended to full length the front surface of the rear half reads from seven to thirteen feet, and the whole front of the rod is figured continuously and becomes a self-reading rod, thirteen feet long, reading to hundredths of a foot.

The back surface of the rear half is figured from seven to thirteen feet, reading from the top down; it has also a vernier scale by which the rod is read to thousandths of a foot as it is extended. The target is round, made of brass raised on the perimeter to increase its strength, and is painted in white and red quadrants; it has also a vernier scale on its chamfered edge, reading to thousandths of a foot.

When a level of less than seven feet is desired the target is moved up or down the front surface, the rod being closed and clamped; but when a greater height is required the target is fixed at seven feet and the rear half extended, the vernier scale on the back giving the readings like those of the target to thousandths of a foot.

THE BOSTON ROD.

(No. 503.)

This rod is formed of two pieces, each about six feet long, sliding easily by each other in either direction.

One side is furnished with a clamping piece and screw, with a small vernier at each end; the other or front piece carries the target, and has on each side an inlaid strip upon which graduations of feet, tenths and hundredths are marked and figured.

The target is a disk of brass raised on its perimeter, fastened on the front half, and is painted red and white, having its middle line just three-tenths of a foot from the end of the rod.

Each tenth graduation is figured decimally in three figures, or to hundredths of a foot, and by the verniers is read to thousandths.

The target being fixed, when any height is taken above six feet, the rod is changed end for end and the graduations read by the other vernier, the height to which the rod can be extended being a little over eleven feet.

This rod is very convenient on account of its lightness, but the parts are too frail to endure the rough usage of this country; and American Engineers generally prefer other rods which are heavier and more substantial.

No. 503. BOSTON ROD. Price, \$14.00.

THE TROY ROD.

(No. 504.)

No. 504. TROY ROD. Price, \$10.00.

The cut represents another form of the sliding leveling-rod, called the Troy rod. This is a self-reading rod up to six feet, or it can be read by a vernier on the rear piece to thousandths of a foot, as usual.

It has two targets as shown, both fastened to the front half of the rod, the lower one having its middle line just three-tenths of a foot above the end, and the other target exactly six feet above the lower.

There is a clamping piece with screw on the back of the rod, below the upper target, by which the two parts are clamped together when desired.

The face of the front piece is recessed like that of the Philadelphia rod, painted white, graduated to feet and hundredths, and figured as represented.

The side of the front half is graduated to feet and hundredths, read by a vernier on the top of the rear half to thousandths, and figured from the top downwards, beginning with three-tenths, that being the height of the middle line of the lower target.

When a level of less than six feet is taken on the rod the observation is made by the lower target, and the reading is direct as given on the side; but when a greater height is taken the upper target is sighted upon, and six feet added to the reading on the side, a

reading up to twelve feet being thus readily obtained.

THE NEW YORK ROD.

(No. 505.)

This rod, which is shown in the engraving as cut in two, so that the ends may be exhibited, is made in two parts, the pieces sliding one from the other, the same end being always held on the ground, and the graduations starting from that point.

The graduations are made to tenths and hundredths of a foot, the tenth figures being black, and the feet marked with a large red figure.

The front surface, on which the target moves, reads to six and one-half feet on the two-part rods. When a greater height is required, the horizontal line of the target is fixed at the highest graduation, and the upper half of the rod carrying the target is moved out of the lower, the reading being now obtained by a vernier on the graduated side, up to an elevation of twelve feet.

The target is round, made of brass with a raised rim to strengthen it and to protect the paint from being defaced.

The target is arranged with an improved clamp, which can be so adjusted as to regulate the friction on the rod, enabling the target to be easily moved up and down, and to be clamped with a slight turn of the binding-screw.

No. 505. NEW YORK ROD, in 2 parts (improved pattern). Price, \$14.00.

No. 507. NEW YORK ROD, in 3 parts. Price, \$18.00.

The face of the target is graduated into quadrants by horizontal and vertical diameters, the quadrants being painted alternately white and red, or sometimes white and black.

The opening in the face of the target is nearly two-tenths of a foot long, so that in any position a figure noting a tenth of a foot can be seen on the surface of the rod.

The right edge of the opening is chamfered, and graduated into ten equal spaces corresponding with nine hundredths on the rod. The graduations start from the horizontal line which separates the colors of the face.

The vernier, like that on the side of the rod, reads to thousandths of a foot. The rod is fitted with the improved clamp.

THE NEW YORK ROD.

In three parts. (No. 507.)

In this rod, as shown, a third piece is added, giving a rod of a greater length, and at the same time making it more compact and portable.

The graduations, verniers, and readings are the same as those of the rod in two parts.

The three-part rod allows a reading of twelve and one-half feet, and when closed is five feet long.

THE ARCHITECTS' ROD.

(Nos. 510 and 511.)

This is a very light and simple sliding rod in two equal parts, each seven-eighths of an inch square, and when closed the rod is about five feet six inches long.

As shown, the front half is graduated on two sides to feet, tenths and hundredths, reading by verniers on the target and side to thousandths of a foot.

The target is similar to those of the rods already described, and it moves on the closed rod when levels of less than five and four-tenths feet are to be taken.

When a greater height is needed, the target is fixed at the highest graduation, the front half carried above the rear part and clamped by the clamp-screw at any point desired, the height up to ten feet being now read off by the vernier on the lower half.

This rod is adapted for use with any Level, and is so light and efficient that it has been received with favor. It is, however, generally used with the Architects' and Drainage Levels.

When it is designed for Architects' use the graduations are in feet, inches and sixteenths, and no verniers are required.

No. 511. ARCHITECTS' ROD. Price, \$6.00.

THE MACHINISTS' ROD.

(No. 512.)

The Machinists' rod is made in one piece with a cross-section about seven-eighths of an inch square and a length of six and one-half feet, and is graduated on one face to feet, inches and sixteenths. At one end and attached to the rod with a swivel is a large hook by which the rod may be hung from a shaft. The target is painted red with broad white lines crossing the center and is fitted with candle-holder. This rod is designed especially for use in leveling shafting in factories and in conjunction with the Architects' Level will be found most serviceable.

THE TELEMETER ROD.

(No. 513.)

The Telemeter, or Stadia, rod is formed of two pieces of pine, each two and one-half inches in width and six feet long. The inner surfaces of the rod are recessed to protect the graduated surface, and painted white, with graduations in black to feet, tenths and hundredths, the feet figured in red and the tenths in black. The two pieces are connected by strong brass hinges and folded in transportation. When in use they are opened, laid flat and held firmly in line

by a strong brass clip on the back of the rod. The rod tapers toward the top from a thickness at the bottom of one and one-eighth inches. This is a self-reading rod, and is often used in connection with the stadia to ascertain distances by simple observation, in the same manner as the Philadelphia rod already described. The price is \$12.00.

NO. 515. TELESCOPIC ROD. Price, \$22.00.

THE TELESCOPIC ROD.

(No. 515.)

This rod is made so that the two smaller upper parts slide out of a larger and lower part which answers as a case. When closed the rod is five feet long, and it extends to fourteen feet. It is graduated on a recessed face to feet, tenths and hundredths, the graduations being painted and figured like those of the Philadelphia and Telemeter rods.

THE CROSS-SECTION ROD.

(No. 516.)

This rod is made of well-seasoned pine, and is ten feet long and one and one-half inches square at the ends; it is about four inches thick in the middle, where there is an opening for the hand, as shown. Both sides are graduated on a recessed white surface, the graduations being painted black like those of a leveling-rod, and figured

NO. 516. CROSS-SECTION ROD. Price, \$10.00.

from the same end of the rod. There is also an adjustable spirit-level at each end, one of which is shown in the cut.

PLAIN LEVELING-ROD.

No. 518.

A very good self-reading rod is made of seasoned white pine, recessed and graduated on one face like the Philadelphia rod. A rib at the back, extending through the length of the rod, gives great rigidity, while it does not materially increase the weight. The plain leveling-rod is commonly made ten and twelve feet long, but can be made longer, if desired, at an additional cost of about fifty cents per foot. These rods are also made with a hinge joint at the center, at an extra cost of \$2.00. (See page 270.)

METRIC RODS.

Besides the usual graduation of leveling-rods into feet and parts of a foot, we graduate them, when desired, into meters, decimeters and centimeters. The scales on the targets and sides of the rods read the centimeters to millimeters on all except the telescope, telescopic and plain rods, which have no targets and are read only to centimeters. The New York, Troy, Boston and Architects' Metric rods are graduated, when desired, to read by vernier to one-tenth of a millimeter.

No. 518. PLAIN LEVELING-ROD. Price, \$6.00.

No.
530.

LEVELING-POLE.

The leveling-pole, shown in No. 530, is a combination of a plain self-reading rod and a flagpole. It is made with flat face, front and rear, and rounded sides. One face is graduated to feet and hundredths of a foot, while the other face and sides are graduated to feet only and are painted red and white alternately. The pole is made seven and nine feet long, the graduated faces reading to six and eight feet respectively, and when used as a rod is read, as shown in the cut. The prices are \$5.00 and \$6.00.

WOOD AND IRON FLAGSTAFFS.

We make three sizes of the common wood flagstaffs, or ranging-poles. They are octagonal in form, tapering from the bottom to the top, six, eight, and ten feet long, and have steel shoes. (See cut No. 534.)

We also make a convenient ranging-pole of an iron tube, eleven-sixteenths of an inch in diameter, hung in gimbals so that it can be readily set over a given point. (See cut No. 539.) Similar iron poles are made without gimbals, six, eight, and ten feet long.

These staffs are graduated to feet, and painted alternately red and white.

They are also graduated metrically, when desired, five spaces to each meter.

We also make wood ranging-poles, round, six and nine feet long, and with screw joint at each three feet. Prices, \$4.50 and \$7.50.

No.
534.

No.
539.

THE ROD-LEVEL.**NO. 545. ROD-LEVEL.**

Price, \$3.00.

ROD-LEVEL AS APPLIED TO A ROD.

No. 545 represents a level for the more accurate plumbing of leveling-rods and ranging-poles. The figures show it when folded for carrying, and also as attached to a rod.

It is held in place by the hand, or can be secured by a string or rubber band to hooks attached to each plate of the level. Its convenience and value have commended it to general favor.

CIRCULAR ROD-LEVEL.

We also make a Rod-Level with circular level-vial, folding against the rod when not in use. This level is to be attached to the rod, and hence it cannot be used where there is a target or clamp-band to slide past it. It is very serviceable on self-reading and stadia rods.

Price \$3.00. See No. 546 in Price-List.

NOTE.—For prices of Leveling-Rods, Flagstuffs, jointed Ranging-Poles, and Rod-Levels see pages 269 to 271 of the Price-List.

THE PLANE-TABLE.

THE recognized utility of the Plane-Table for topographical and map drawing is bringing it into use in this country ; and to meet the demand for instruments of moderate cost and real efficiency we have introduced several patterns of the Plane-Table.

No.	NO. 553.	PRICE.
553.	Plane-Table, board 30x24 inches, mounted on large tripod, with leveling-socket and clamp, plumbing-arm, plummet and clamps for paper.....	\$45.00
	Combined Compass and levels.....	15.00
	Alidade, with telescope 9 inches long, power 20 diameters, with stadia, vertical circle to 1 minute, level on telescope and clamp and tangent, mounted on column as in engraving.....	70.00
	Price as shown, total.....	\$130.00

The Plane-Table consists mainly of a drawing-board upon a firm tripod, as shown in No. 553, having upon its upper surface a movable straight-edge or Alidade, arranged either with sight-vanes or telescope, by which it may be directed to any given point, a line being then drawn on the paper along the edge of the Alidade.

A square brass plate, to which is attached a Compass with two spirit-levels, is also shown, and serves both to

THE COMPASS. level the table and, when applied by the edges parallel to the zero-lines of the compass-circle, to determine the magnetic bearing of the lines drawn on the paper, or the direction of the table itself.

The table is made of wood arranged in sections so as to prevent warping, and has an adjustable wooden roller **DRAWING-BOARD.** at each end, by which the paper is brought down snugly to the board or upon which a long sheet can be rolled and unrolled at will. Sometimes in place of the rollers, and often in combination with them, a number of brass clamps, as shown, are used in holding the paper firmly.

Still another method of fastening the paper to the board is shown in the cut on page 197, in which are represented small brass screws passing through the paper and into brass sockets let into and slightly below the surface of the board. This method allows the Alidade to move over the surface without interference.

The plumbing-arm shown in the figure has its end brought to a point, that it may be set at any given point on the paper, the plummet hanging from the **PLUMBING-ARM.** under arm determining the corresponding point on the ground. The lower arm moves upon a hinge, an index on the side showing when the ends of the two arms are plumb with each other as applied to the table.

The construction of the socket and tripod head is shown below, *a* representing the hemispherical concave **THE SOCKET** metal cup fastened by six screws to the **AND TRIPOD.** wooden top of the tripod, *b* the upper or convex part fitting nicely into the cup and clamped to it at will by the clamping piece, *c*, and nut, *d*. A strong spiral spring in the hollow cylinder between *c* and *d* serves to hold the two spherical surfaces of the socket together and allows the easy movement of one within the other in the leveling of the table.

The flange of the socket, *b*, supports the table and is connected with it by three segments of brass, two of which are shown at *e e*. The table can be oriented at will and clamped by a milled head screw passing through one of these segments.

PLANE-TABLE WITH LEVELING-SCREWS AND TANGENT MOVEMENT.

The cut on page 196 shows a modification of the simple Plane-Table, there being added a tangent movement in azimuth and three screws for leveling.

The board appears as if cut away, to show in detail the socket and leveling-screws and tangent movement, by which, as will be seen, a more delicate orienting may be obtained than by the simple movement before described.

The Plane-Table outfit as shown above is our No. 549 and costs as follows :

	PRICE.
Plane-Table, board 30 x 24 inches, mounted on large tripod, with leveling-socket and clamp, and with plumbing-arm, plummet, and clamps for paper.....	\$45.00
Set of three leveling-screws.....	10.00
Clamp and tangent, for movement in azimuth.....	10.00
Combined Compass and levels, with square base	15.00
Alidade, with telescope 11 inches long, with stadia, $4\frac{1}{2}$ -inch vertical circle and vernier to 1 minute, level on telescope and clamp and tangent, on column, power of telescope 24 diameters.....	90.00
Total	\$170.00

The tripod is set up firmly, and the board with the upper half of the spherical socket attached is placed upon the lower half of the socket attached to the tripod, the wing clamping nut being screwed up until the table is secure upon the tripod. The board is then moved by the pressure of the hand, or by the leveling-screws, until the level-bubbles upon the compass-plate will remain in the middle upon any part of the surface. The wing-nut is now screwed up and the board made firm upon the tripod.

Any place on the drawing-board may then be assumed as a starting-point, its position over a given point on the ground being determined by the plumbing-arm and plummet. From the given point on the paper sights can be taken to different corners of the field, and lines drawn on the paper along the edge of the Alidade. Thus a miniature of the tract can be traced on the paper, the bearing of any line being ascertained by applying the side of the compass-plate to the edge of the Alidade placed on that line. The table can be oriented, either by the hand, on releasing the milled head screw that clamps the flange, or by the tangent screw as before described.

The measurement of distances by the stadia wires of the telescope, and of vertical angles by the circle, is effected as already described in our account of the Transit.

*JOHNSON'S IMPROVED PLANE-TABLE
MOVEMENT.*

We illustrate on page 199 what is known as the Johnson Plane-Table Movement, complete with large Alidade, Plumbing-Arm and Compass.

The board is shown as cut away, to give a better view of the tripod and movement. In the lower corner is shown the movement alone, with a portion cut away to show the construction.

This movement has been largely used by the topographers of the U. S. Geological Survey.

As shown in the cut, this movement supplies an arrangement whereby the table can be easily made horizontal and then secured by the large wing-nut, A. To orient the board, the wing-nut, B, is loosened, leaving the hemispherical surface, bearing the board secured to the flange, free to turn, and it can be clamped at will by screwing up the same nut. This movement as modified in recent years supplies an extremely efficient and portable Plane-Table.

The movement with legs complete weighs about nine pounds. The legs are made of straight-grained second-growth hickory, and the construction of the whole tripod is such as to secure strength and accuracy, and it is capable of standing rough usage without getting out of order.

NOTE—Any of the Alidades, as described on pages 200–202, can be used with Johnson's Plane-Table.

See pages 273 and 274 for a list of Johnson's Plane-Table outfits, with prices.

The Johnson Plane-Table outfit as shown above is our No. 576, and costs as follows :

	PRICE.
Johnson's Improved Plane-Table movement, mounted on large tripod.....	\$35.00
Plane-Table Drawing-Board 31 x 24 inches, fitted, and with screw-sockets and clamps for paper.....	5 00
Plumbing-arm and plummet.....	4.09
Combined Compass and levels with square base.....	15.00
Alidade, with telescope 11 inches long, with stadia, $4\frac{1}{4}$ -inch vertical circle and vernier to 1 minute, level on telescope and clamp and tangent, on column, power of telescope 24 diameters.....	90.00
Total.....	<u>\$149.00</u>

THE ALIDADES.

The different patterns of our Plane-Tables vary mainly in their Alidades, of which we make several kinds.

NO. 580. Price, \$15.00.

The simplest Alidade is shown above, and consists of a brass ruler or straight-edge, twenty inches long and about three inches wide, at the ends of which sight-vanes are mounted like those on the ordinary compass. The edge of the ruler is chamfered and in line with the slots of the vanes.

NO. 581. Price, \$50.00.

The lower figure shows the simple Alidade to which is fitted the Telescopic Sight, having a level, clamp and tangent and vertical circle reading to five minutes, attached to the telescope, which has also stadia wires. The telescope is placed in line with the fiducial edge.

The third style of Alidade, No. 582, is shown in the cut of the Plane-Table on page 193, the brass ruler being three inches wide.

The column supports the telescope with its attachments, the vertical circle being graduated on silver and reading to one minute.

The telescope is nine inches long, with a power of twenty diameters, provided with stadia wires and adjusted like that of the Transit.

No. 583. Price, \$90.00.

In the Alidade shown in cut No. 583, the telescope is the same as that used in our best Transits, having also level, clamp and tangent, vertical circle on silver reading to one minute, and stadia wires for measuring distances.

It is placed on a brass ruler four inches wide, and is adjusted and used in the same manner as the one just described.

**No. 584A.**

In Alidade No. 584A, shown in the cut, the blade is eighteen inches long by three inches wide, and carries a circular spirit-level, and a telescope eleven inches long with a detachable striding level, vertical arc and axis tangent, mounted on column. For easy adjustment of the line of collimation the telescope can be turned on its axis through 180° . The vertical arc reads by vernier to one minute; and having its zero at one end, all the angles read are thus positive. The telescope is made either inverting or erecting, as desired, and is fitted with a diagonal prism, with darkener, as shown. A rectangular Box-Compass, with 4-inch needle, and attached to the Alidade, is also furnished when desired, at an extra cost of \$10.00.

No. 584A.—Price, as shown, with inverting eye-piece.....\$118.00

No. 584B.—Price, as shown, but with erecting eye-piece..... 118.00

THE TRAVERSE PLANE-TABLE.

The cut, No. 586, represents a simple form of Plane-Table and Alidade, which is used extensively by the U. S. Geological Survey for traverse work. The board is fifteen inches square, and has on the under side a small brass flange, into which the clamp-screw of the tripod head enters and secures the board to the tripod. The Alidade consists of a brass ruler, ten inches long, graduated on the

**No. 586.**

Price as shown, \$25.00; if the tripod has extension legs, add extra \$5.00.

beveled edge to a scale of forty parts to the inch, and having at each end hinged sights which fold close to the surface of the ruler. The Alidade is furnished with a leather pouch. Inserted in one edge of the board is a small Box-Compass with needle about three inches long.

The tripod legs are attached to a simple head which has a clamping screw passing through its center, compressing a concealed spring and holding the board to the tripod head when oriented to position.

The whole, while not capable of as accurate work as the larger Plane-Tables, supplies a light and portable instrument for topography.

POCKET ALIDADES

A pocket Alidade, of pattern like the one shown with the Traverse Plane-Table, is made six inches long and has hinged sights which fold close to the ruler. The beveled edge is graduated to scale of one forty-five thousandth and one ninety thousandth, each graduation representing one twentieth or one fiftieth of a mile. Price, in leather pouch, \$7.50.

Another form of the pocket Alidade is made seven inches long and has a peep hole for the near sight and for the other a folding sight graduated for a vertical scale representing a rise of twenty-five feet to the mile. The beveled edge is graduated the same as the six-inch Alidade described above. The ruler carries an adjustable level with knurled head leveling-screw. Price, in leather pouch, \$12.00. (See page 274 of the Price-List.)

THE BATSON SKETCHING-CASE.

(PATENTED.)

No. 595. Price, \$30.00.

THE engraving shows the Batson Sketching-Case designed for the use of Civil and Military Engineers and Surveyors in reconnoissance and topographical surveys. It was given an extensive and successful trial, in 1898 and 1899, in Cuba and the Philippines, as well as in the United States.

This instrument is a small drawing-board, having upon its upper surface a movable graduated circle, carrying a small alidade with scales, and at one end of the board a compass and a clinometer.

The drawing-board is made of wood, and is provided with rollers which carry the paper for recording observations. Friction-brakes hold the rollers, so that the paper is held down snugly to the board and prevented from uncoiling.

Six holes at the end of the board opposite the compass

afford receptacles for the pencils used in topographical sketching.

The protractor is held in position by a carrier which slides upon a bar attached to the wooden end-pieces as shown. The construction of the carrier allows the protractor to be turned, or, if desired, to be clamped by means of two set-screws.

The protractor can also be lifted to an upright position by pulling back the spring-catch at the end of the carrier-bar.

The alidade turns within the graduated circle, and, with it, forms the protractor.

The paper for use with this instrument is six inches wide, and thirty to forty inches is found to be a convenient length.

The sketching-case is fitted with a strap for carrying on the forearm, and, if desired, is provided with a short, light staff, or a tripod, for use in taking bearings on reference points and on objects which it is desirable to locate with more accuracy than can be done by holding in the hand.

A sole-leather case, having a pocket for the instrument and another for sketches and extra paper, and fitted with lock and shoulder strap, is provided with each instrument.

TO MOUNT THE PAPER.

Raise the protractor to a vertical position. Having the board with compass to the right, insert one end of the paper in the slit of the far roller and turn the roller toward the board until only seven or eight inches of the paper are left free, then insert the free end in the slit of the near roller and turn the roller toward the board until the paper is taut. Release the protractor and turn it down on the board.

TO SET THE INSTRUMENT.

Release the needle. Face in the general direction of the route to be mapped and hold the instrument in the left hand with the compass to the right ; or, having it set up on the staff, orient it until the long way of the paper is in the general direction of the route to be mapped and the compass to the right. Hold steadily and read the bearing. Unclamp the protractor and turn it until the index on the upper plate of the carrier indicates the same reading on the protractor that is shown by the needle. The instrument is now set, and, if the ruler be turned to zero, it will lie in the magnetic meridian.

*TO PLACE THE CENTER OF THE PROTRACTOR
AND THE ZERO OF THE SCALES OVER
ANY POINT ON THE PAPER.*

Move the paper by turning one of the rollers until the point is opposite the center of the protractor. Unclamp the carrier of the protractor and slide it along the bar until the center of the protractor is over the point.

SCALES.

The alidade carries two scales. The one on the right of the slit, when the clamping arm is to the right, is six inches to one mile ; the one on the left, eight inches to one mile ; each reading to twelve and one-half yards. Should it be desired to use a scale of three inches to one mile, or four inches to one mile, use the six-inch or eight-inch scale respectively, giving the smallest reading a value of twenty-five yards. In the same way a scale of one and one-half inches to one mile, or two inches to one mile, may be obtained, the smallest reading being fifty yards. If the distance is measured by counting paces, find, by pacing over a

measured distance, the number of steps or alternate steps, taken in one hundred yards; then, for each time this number of steps is counted, score one hundred yards. The total score will then be in yards, and is marked off on the scale of yards. This method will be found to cause no confusion. The soldier is trained to estimate distances in yards, and, as a great deal of estimating of distances is required in topographical work, a greater degree of accuracy can be obtained if only a scale of yards is used, than if a scale of steps is used when the distance is paced, and a scale of yards when the distances are estimated. The latter method is also open to the objection that two scales must be prepared before commencing the work. Few non-commissioned officers and privates understand scales sufficiently well to construct one, although but little explanation is necessary to enable them to use one already constructed.

For keeping tally, a "tally-register" is most convenient, but any small pasteboard counter will answer.

TO USE THE SKETCHING-CASE.

I. *As a Plane-Table*: Set the instrument as explained. Select a point on the paper for the initial station. This point should ordinarily be about midway of the edges of the paper; but when it is known that the route to be traveled deviates considerably to one side or the other from the general direction, then the point should be selected on the opposite side of the paper. The instrument should be always so set and the point representing the initial station so selected, that as much of the map as possible may be sketched without running off the paper. Having selected the point representing the first station, center the protractor over this point. Now, holding the instrument in the left hand, or

having it mounted on the staff, orient it until the reading of the needle corresponds to the reading of the protractor circle. Holding it steady in this position, turn the alidade upon all objects it is desired to plot on the map, and draw light lines in the slit from the station-point toward them. These objects should include the next station to be occupied. After having taken the slopes in the vicinity and sketched in the detail, the ruler is clamped in the direction of the next station.

II. *By Plotting the Compass Readings:* With the protractor set as explained in a previous paragraph, orient the instrument until the right-hand edge of the board is in line with the object to be plotted upon the map, and then read the Compass. Now, turn the ruler to the corresponding reading on the protractor circle.

Bearings taken with the Box or Prismatic Compass may be plotted upon the map in the same manner.

THE CURRENT-METER.

AFTER six years' experience in measuring the velocity of water in the Ohio and Mississippi rivers by different methods, W. G. PRICE, then a U. S. Assistant Engineer, devised the Current-Meter known by his name, and shown herewith. It is used by the U. S. Engineer Corps, the U. S. Coast and Geodetic Survey, and by Hydraulic Engineers in different parts of the country.

BUCKET-WHEEL. The wheel of this Meter carries five conical buckets, as shown, so arranged as to feel the force of the slightest current and cause the wheel to revolve.

The ends of the axis of the wheel revolve in bearings contained in air-chambers of metal, which protect them from the water and any gritty matter it may contain, and the friction is thus reduced to a minimum and made a constant quantity. The form of the wheel and buckets is such as to insure great strength and thus resist injury from driftwood, while at the same time it is not liable to obstruction from floating leaves and grass.

AXIS. The axis of the wheel, at the upper end, extends above its bearing, entering an air-tight metal box hereafter named, and is cut down for a short distance, forming an eccentric.

A light spring, so arranged that it comes in contact with the eccentric, bears upon this divided part of the axis and successively makes and breaks the electric circuit as the wheel revolves.

The spring and divided axis form the *contact-breaker*, and are both contained in the little metal air-tight box which is shown in the cut.

LEAD WEIGHT
AND ROD.
Price, \$15.00

No. 606. B

A hollow cylinder of bronze, called the trunnion, fitting easily upon the rod, supports the frame of the Meter by

TRUNNION. a pivot on each side, and thus by the rod and pivots the Meter is free to move both horizontally and vertically, and so adjust itself to the direction of the current.

The frame of the Meter is made of bronze, and is very solid and strong. The rudder has four light metal wings
FRAME AND or vanes, secured to a central rod, and is
RUDDER. made to balance the weight of the wheel and give direction to it, and thus keep the wheel in both directions in line with the current. The Meter-frame has a hinged side secured by a spring key, allowing the Meter and trunnion, which is itself in two parts, to be detached from the rod when desired. In the older form the trunnion was left on the rod. The connecting wires are passed upward through the trunnion of the Meter, and so have no tendency to pull the Meter out of the line of the current.

The rod is of brass three-quarters of an inch in diameter and two feet long, its upper end having an eye of brass screwed firmly on and pinned, and its lower end screwed into a brass socket in the lead weight, B, and secured thereto by a jam-nut. A sliding ring of metal with set-screw, as shown, allows the Meter to be raised to any point on the rod.

The weight, No. 606, is of lead and weighs about sixty
LEAD WEIGHT. pounds ; it has a rudder of wood, as shown, secured to the weight by brass cheek-pieces, which are also securely fastened to the weight by sockets cast into the lead. The rudder can be set at an angle with the weight, or turned up parallel with the rod, for convenience in transportation.

The weight, B, is only used where the Meter is em-

ployed in deep water and harbor surveying, where the currents are very strong. In shallower waters the Meter is suspended upon a brass rod. These rods are each four feet long and can be screwed together when a long length is needed. They are graduated to feet and tenths.

SIZE OF THE METER.

This Meter has a wheel six inches in diameter, and the total length, including the rudder-vane, is about twenty-four and one-half inches long. It is adapted for deep water and harbor surveying, and also for use in smaller rivers and streams, and is used either with or without the weight.

RATING THE METER.

Before using the Meter it is necessary to obtain its rating, which is the number of revolutions of its wheel made in passing over a measured distance, at different velocities.

The Meter should be rated in still water which is not less than five feet deep, and to secure a good rating there should be but little wind.

It should be attached to the bow of a skiff, as shown in the cut, and immersed not less than two feet. The boat should have no rudder. The observer should also stake out two parallel range lines on shore, about two hundred feet apart and at right angles with the course the boat is to take.

Attach a quarter-inch cotton cord about three hundred feet long to the bow of the boat, and pass it around a pulley which is placed in line with the course; if there is a bend in the shore the pulley may not be necessary.

It will require three or four men to pull the boat fast enough for the high velocities, and there must be a boatman with oars in the boat with the observer, to prevent its running into the shore.

Haul the boat over the measured base at very slow, very fast and medium velocities, which should be as nearly uniform as possible during each passage.

Note before each trial if the Meter is free to point in the direction of the current, as the connecting wires are

liable, in backing over the course, to get twisted so as to pull the Meter out of line.

Fasten a vertical rod on the boat near the seat of the observer, to enable him to sight at the range stakes as he passes them ; start the Time-Recorder (No. 619 of Price-List) and Electric Register on the first range-line and stop them on the second ; and note accurately the time as given by the Time-Recorder, and the number of revolutions of the wheel as indicated by the Register.

The rating of a Meter (which is, in brief, the value in feet per second of one revolution of the wheel) will not change as long as the wheel turns freely and has not been seriously injured.

The velocity of a current of water can readily be computed from the Reduction-Table furnished with the instrument, and also given on pages 217 and 218, the number of revolutions of the wheel per second having been already ascertained by observation, and recorded by the Register.

Should the observer require greater accuracy, it is advisable that the individual rating of each Meter be ob-

tained. If desired, we will rate the Meter, and furnish a reduction-table at a cost of about thirteen dollars.

ELECTRIC REGISTER.

The number of revolutions of the Meter-wheel is recorded by an Electric Register (shown as No 609) actuated by a battery of three cells

The electric current proceeding from one pole of the battery is carried by an insulated copper wire down through the trunnion of the Meter, and thence up to the insulated binding-post on the upper arm, as shown in the cut ; thence through the contact-breaker, the axis of the wheel, and the lower arm, to the binding-screw shown on that arm ; thence by a second copper wire up through the trunnion to one binding-screw of the Register ; thence through the Register to the other binding-post ; and thence, finally, by another wire to the other pole of the battery.

The Electric Register is enclosed in a brass case, showing three dials under a glass face, and has an electro-magnet which, when the circuit is made, moves a lever, at the end of which is a pawl carrying forward a ratchet-wheel one tooth at every contact of the current. The large dial is graduated into one hundred spaces and two small dials into ten spaces each, all reading from left to right. The large dial counts each revolution up to one hundred,—the small dial on the right counts one thousand revolutions by each hundred,—and the small dial on the left counts ten thousand revolutions by each thousand,—all indicated by the figuring.

We furnish a wet-cell battery to operate the Electric Register. The battery is composed of
BATTERY. three cells enclosed in a neat wooden case, with lock and strap.

See No. 612 of the Price-List.

REDUCTION-TABLE FOR USE WITH ELECTRIC CURRENT-METER, PATTERN No. 600.

MULTIPLY THE MEASURED VELOCITY BY THE PERCENTAGE.

PRICE'S ACOUSTIC CURRENT-METER.

(PATENTED.)

This Meter was devised by W. G. PRICE, and has many points of excellence. It is very compact, light and portable, and is especially designed for use in irrigation ditches, or streams where there is little depth of water. The cut shows

No. 616.
Price, \$50.00.

the external appearance of the Meter, with the brass tubes by which it is held while in use. The revolutions of the wheel are indicated by a hammer striking against a diaphragm, one blow for every ten revolutions, and the recording mechanism is enclosed in the stem of the Meter and thoroughly protected from injury. The sound of the recording stroke is transmitted through the tubing supporting the Meter, and is conveyed to the ear of the operator by the rubber ear-tube. In use the operator fixes the ear-tube in position by a rubber

band passing around his head, and thus both hands are left free for the manipulation of the Meter. Results obtained may be readily reduced by the use of the Reduction-Table supplied with the Meter, and also given on pages 220 and 221.

Each Meter is packed in a wooden box with lock and strap, and is provided with two lengths of nickel-plated brass tubing, graduated to feet and tenths up to four feet, and with four feet of rubber tubing with all necessary connections. Extra graduated brass tubing, in lengths of two feet, will be furnished when desired, at a cost of \$2.50 per length.

REDUCTION-TABLE FOR USE WITH
PRICE'S PATENT ACOUSTIC CURRENT-METER.
PATTERN No. 616

This table is a mean of the ratings of fourteen Meters and will probably give correct values within one per cent. for any Meter of its pattern when in good order.

The time column is the number of seconds that have elapsed during 100 revolutions of the wheel, there being ten revolutions to each "rap."

*ELECTRIC CURRENT-METER, WITH VANE AND
LEAD WEIGHT.*

FOR USE IN SMALL STREAMS.

No. 617.

Price, as shown, \$60.00.

The importance of correct hydraulic measurements has brought the Current-Meter into general use, and while the Current-Meter, No. 600, has long been recognized as standard for observation on large streams, in recent years there has been a demand for a light and serviceable instrument for use in small streams and irrigation or drainage ditches.

In response to this demand, the Acoustic Current-Meter, indicating by sound the revolutions of the wheel, was intro-

duced, and this instrument has met with a favorable reception by hydraulic engineers

Many observers, however, prefer that the revolutions of the wheel should be indicated by the making and breaking of an electric current.

For some time, aided by the suggestions of the engineers in charge of the hydrographic work of the United States Geological Survey, we have been perfecting the small Electric Current-Meter shown in the cut, and listed in our catalogue as No. 617. This Meter, while constructed practically along the lines of Current-Meter No 600, has the advantage of extreme lightness, weighing only about two pounds

The electrical connection is made in the same manner as is described under Meter No. 600. The Meter is supported in a trunnion, and is free to swing in a vertical plane. The vane is so made that, if desired, it may be taken apart for convenience in transportation.

In use, the Meter is suspended by a cable containing the wires for electrical connection, and is held steady by a lead weight, as shown in the cut.

The electric sounder is very simple, consisting of a "buzzer" attached to a small leather case containing a bi-sulphate of mercury battery cell.

Each revolution of the wheel is indicated by a "buzz," the observer being required to count the number in a certain period of time

The Meter is packed in a wooden box, strongly made, and of a capacity sufficient to contain the Meter, lead weight, sounder, wire and other apparatus for the observer.

A table for reducing observations has been prepared which will give correct values within one per cent.

Should the observer require greater accuracy, it is ad-

visible that the individual rating of each Meter be obtained. If desired, we will rate the Meter, furnishing table at a cost of from twelve to thirteen dollars.

The price of Meter No. 617 is\$50.00
 The price of the lead weight is..... 2.50
 The price of the sounder is. 7.50
 The price of the Meter, including lead weight and sounder and
 twenty feet of cable, is 60.00
 Extra length of cable, 5 cents per foot.

Reduction Table for use with Electric Current-Meters Nos. 617 and 618 This table is a mean of the ratings of ten separate Meters and will probably give correct values within one per cent. of any meter of its pattern in good order.

*ELECTRIC CURRENT-METER, OMITTING VANE
AND LEAD WEIGHT.*

FOR USE IN SHALLOW STREAMS.

No. 618.

Price, complete, \$60.00.

A modification of the Electric Current-Meter, No. 617, is shown in Fig. No. 618. The vane, lead weight and supporting cable are omitted. The meter is mounted on a base as shown, and is provided with two lengths of nickel-plated brass tubing, graduated to feet and tenths up to four feet, and is readily held in position with the base resting on the bed of the stream. The electric sounder, with twenty feet of cable, and connections are the same as used with Meter No. 617. The Meter and its smaller accessories are packed in a wooden box with lock and strap. Price, complete, is \$60.00.

The reduction table on page 224 is also for use with this Meter.

BOYDEN'S HOOK-GAUGE,

So called from the name of its inventor, is used in determining the depth of water flowing over weirs, etc.

As represented in the cut, it has a frame of wood, three feet long and four inches wide, in a rectangular groove of which another piece is made to slide, carrying a metallic scale, graduated in feet and hundredths, and figured from zero to two feet and two-tenths, as shown.

Connected with the scale is a brass screw passing through a socket, fastened to another shorter sliding piece, shown above, which can be clamped at any point on the frame, and the scale with hook moved in either direction by the milled head nut.

There is also a vernier attached to the frame, and movable under the screw heads which secure it, in order to adjust its zero to correspond with the point of the hook, as will be described hereafter. The vernier reads the scale to thousandths of a foot.

The hook is of brass, and has a sharp point which, when raised to the surface of the water at rest, indicates its precise level.

No. 620.

Price, \$25.00.

*TO USE THE HOOK-GAUGE.*

The hook-gauge is used in a box attached to a flume at any convenient point near the weir, the water in the flume being conveyed to the box by rubber or lead pipes, and thus indicating the precise level of the water in the flume, the surface of the water in the box being also at rest.

When the depth of the water passing over a weir is required, the exact level of the crest of the weir should be taken by a leveling-instrument and rod, and designated by a line drawn in the still-water box above the surface of the water. The scale of the gauge being previously set at zero with the vernier, the frame is fastened to the box above the water in such a position that the point of the hook is at the same level with that of the crest of the weir, the precise point being secured by the adjusting-screw of the scale. Now see that the zeros of the scale and vernier are in line, and if not, move the vernier under the screw heads until the zeros correspond, and set the vernier fast. The point of the hook will, of course, be under water, and at the same time level with that of the crest of the weir.

The depth of the water flowing over the weir is the distance between the point of the hook in the position named and the exact surface of the water. To find this, the hook is raised by turning the milled head nut until the point of the hook, appearing a little above the surface, causes a distortion in the reflection of the light from the surface of the water; then a little movement of the hook in the opposite direction will cause the distortion to disappear, and will indicate the surface with precision. The reading of the scale will then give the depth of water passing over the weir, in thousandths of a foot.

It will be understood from the cut that the longer movements of the scale are made by moving the clamping piece over the frame, the smaller adjustments being effected by the milled nut.

NOTE.—We also make to order, from designs furnished, Water-Registers, Tide-Gauges and similar instruments.

TELESCOPIC HAND-LEVELS.

**No. 625.**

Price, \$12.00.

No. 627.

Price, \$15.00.

The figures represent instruments devised by us to remedy the defects of the ordinary Hand-Levels, and to increase their usefulness in the work of the engineer.

The Monocular Hand-Level, shown as No. 625, consists of a tube to which are fitted the lenses of a single opera-glass, containing in addition a reflecting prism, cross-wire and level-vial, the last being shown in the open part of the tube.

The eye-lens, as indicated in the cut, is made of two separate pieces, the larger one being the usual concave eye-lens of the opera-glass and the smaller one a segment of a plano-convex lens, having its focus in a cross-wire under the level-vial and above the reflecting prism.

The observer holds the tube horizontal with the level-opening uppermost, and observes the object to which the

instrument is directed and the position of the level-bubble with reference to the cross-wire on the under side of the level-vial.

When the Hand-Level is held truly horizontal the cross-wire will bisect the bubble, and will also determine the level of any object seen through the telescope ; thus securing to the observer a clear view of the object, magnified also by the telescope.

The Binocular Hand-Level, shown as No. 627, consists of two tubes, that on the right enclosing the usual lenses of the opera-glass, while the tube on the left contains only the prism, level-vial and cross-wire of the instrument just described.

This Level is used like the ordinary opera-glass, the level-vial being above, as shown in the cut.

When the tubes are held truly horizontal, the engineer, with one eye, will see the cross-wire bisecting the bubble, and, with the other eye, the object observed, the level line of which is determined by the position of the cross-wire upon the surface of the level-vial.

The use of the Binocular Hand-Level gives a clearer view of an object than is possible with a single tube, there being now no light lost by the interference of the prism and level-vial.

The Hand-Level is adjusted by sliding the prism-tube back and forth until the line given is the same as that given by a Y-Level.

The prism in the tube can be reached by removing the cap from the closed end of the tube, and it is clamped by a small screw on the lower side.

LOCKE'S HAND-LEVEL.**NO. 630.**

Price, \$8.00.

This instrument consists of a brass tube about six inches long, having, as shown in the figure, a level-vial on top and near the object end. There is also an opening in the tube beneath, through which the bubble can be seen, as reflected by a prism immediately under the level-vial. Both ends of the tube are closed by disks of plain glass to exclude the dust, and there is at the inner end of the sliding or eye-tube a semi-circular convex lens, which serves to magnify the level-bubble and the cross-wire beneath, while it allows the object to be clearly seen through the open half of the tube.

The cross-wire is fastened to a little frame moving under the level-tube and adjusted to its place by the small screw shown on the end of the level-case. The level of any object in line with the eye of the observer is determined by sighting upon it through the tube, and bringing the bubble of the level into a position where it is bisected by the cross-wire.

*THE ABNEY LEVEL
AND CLINOMETER.*

No. 634.

The Abney Level is a modification of the Locke's Hand-Level, combining with it an excellent clinometer, as shown in the cut.

The main tube being square, it can be applied to any surface, the inclination of which is ascertained by bringing the level-bubble into the middle and reading off the angle by the vernier and arc; or when sighted at an object and the bubble brought into the middle, the vertical angle from the height of the eye is indicated. When at zero it would indicate a level line.

The inner and shorter arc indicates the lines of different degrees of slope, the left-hand end of the vernier being applied to the lines and the bubble being brought into the middle, as usual. A small compass, with needle about one and one-half inches long, is sometimes attached to the upper surface of the Abney Level, with a plain staff socket below.

CHAINS.

The sizes and diameters of iron and steel wire commonly used in making surveyors' and engineers' chains are as follows: No. 8, .162-inch; No. 10, .135-inch; No. 12, .105-inch; No. 15, .072-inch; No. 18, .047-inch.

The ordinary GUNTER'S or surveyors' chain is sixty-six feet or four poles long, composed of one hundred links, each connected to the other by two rings, and furnished with a tally-mark at the end of every ten links. A link in measurement includes a ring at each end, and is seven and ninety-two one-hundredths inches long. In all the chains we manufacture the rings are oval and are sawed and well closed, the ends of the wire forming the hook being also filed and bent close to the link, to avoid the danger of kinking. The oval rings are about one-third stronger than round ones.

The handles are of brass and form part of the end links, to which they are connected by a short link and jam-nuts, by which also the length of the chain is adjusted.

The tallies are of brass, and have one, two, three or four notches, as they mark ten, twenty, thirty or forty links from either end. The fiftieth link is marked by a rounded tally to distinguish it from the others.

In place of the four-pole chain just described, many surveyors prefer a chain two rods or thirty-three feet long, and having only fifty links, which are counted by tallies from one end in a single direction.

Our surveyors' chains are made of Nos. 8 and 10 refined iron wire, and of Nos. 8, 10, 12 and 15 best steel wire. Steel chains, though more costly than those of iron, are often preferred on account of their greater strength.

Engineers' chains differ from surveyors' chains, in that a link including a ring at each end is one foot long, and the wire is of steel and therefore much stronger.

They are either fifty or one hundred feet long, and are furnished with swivel handles and tallies like those just described

The wire used for these chains is of steel, Nos. 8, 10 and 12 of the first quality.

A very light and strong chain is made of No. 12 steel wire, the links and rings of which are securely brazed. The wire is of a low spring-temper, and the chain though light, is almost incapable of being either broken or stretched in ordinary use.

Our brazed steel chains have been found exceedingly desirable for all kinds of measurement, and for the use of engineers upon railroads and canals they have almost entirely superseded the heavier chains.

We often make chains with steel snaps in the middle and at one handle. The chain can then be separated, and one handle being removed and transferred to the forty-ninth link, a chain of half length is obtained. This modification is made without charge if ordered with the chain.

TO USE THE CHAIN.

In using the chain the length must be taken from the extreme ends, and the marking-pins placed on the outside

of the handles. It must be drawn straight and taut, and carefully examined to detect any kinks or other causes of inaccuracy.

STANDARD MEASURE. Our chains are all carefully tested at every link and in their whole length, by the U. S. standard, with a strain of ten pounds and with temperature at 62° Fahrenheit, and when new may always be relied upon as correct.

But as all chains will be lengthened more or less after long use in the field, it will be best for the surveyor to carefully lay down on a level surface the exact length of the chain when new, marking its extreme ends by monuments which will not be liable to disturbance.

He will thus have a standard measure of his own to which the chain can be adjusted from time to time, and again be used with perfect confidence.

GRUMMAN'S PATENT CHAINS.

These chains, invented and patented by J. M. Grumman, of Brooklyn, N. Y., are made of very light steel wire, the links being finely tempered, and, as shown in the cut, so formed at the ends as to fold together readily, and thus dispense with the use of rings.

This construction gives but one-third as many wearing points as on the ordinary chain, and affords the utmost facility for repairs.

Five or ten extra links are furnished with each chain, and these have only to be sprung into place to replace

such as may have been broken. The chain can also be sprung apart at any link, and thus be made of any length desired.

Some of these chains are made of No. 15 wire, and are used for measuring on the surface like the ordinary chain. One is used as a suspended chain, for very accurate measurements, and is made of No. 18 wire and provided with spring-balance, level and thermometer attachments. It is held above the surface when in use, and the extremities of the chain are marked upon the ground by the points of plummets let fall from fixed places on the chain.

VARA CHAINS.

The vara, which is in general use in Texas, is 33.333 inches long. The chains are made both of iron and steel wire, ten or twenty varas in length, each vara being usually divided into five links. A link, including a ring at each end, is therefore 6.666 inches long. A ten-vara chain has fifty links; a twenty-vara chain one hundred links. Each vara is marked by a round brass tally, numbered from one to nine in the ten-vara chain, and from one to nineteen in the twenty-vara chain.

METER CHAINS.

The meter is used as a standard measure of length in many countries, and chains of ten and twenty meters are often ordered. The chains are made of iron or steel wire, each meter being divided into five links; a meter being 39.371 inches long, a link, including a ring at each end, is therefore 7.874 inches long.

A ten-meter chain has fifty links and a twenty-meter chain one hundred links. Each meter is marked with a round brass tally numbered from one to nine in the ten-

meter chain and from one to nineteen in the twenty-meter chain.

MARKING-PINS.

In chaining, eleven marking-pins are needed, made either of iron, steel or brass wire, as may be preferred, about fourteen inches long, pointed at one end to enter the ground, and formed into a ring at the other end for convenience in handling.

Marking-pins are sometimes loaded with a little mass of lead around the lower end, to answer as a plumb when dropped to the ground from the suspended end of the chain.

CHAIN-TAPES.

Chain-tapes are made of a thin ribbon of steel, about one-quarter of an inch wide, and of straight spring-temper. They are usually made in lengths of thirty-three to five hundred feet; and are generally used on bridge, road and street work, and also as standards for comparison of other chains and tapes.

The thirty-three and sixty-six feet lengths are usually graduated at each Gunter's link for use in land-surveying; and the fifty and one hundred feet lengths are graduated at each foot, and also have the first and last foot marked in tenths for city work. See Price-List, Nos. 760-767.

No. 760.

A simple and convenient reel for these tapes is shown in the above cut. The handle of the drum when not in

use can be folded flat, and a small projection at its base fits into a slot made to receive it and thus clamps the drum and prevents the tape from unwinding.

NO. 770.

The longer tapes, from three hundred to five hundred feet in length, are usually graduated at each five feet, and also have the first and last five feet marked at each foot. They are wound upon a substantial wooden reel, with aluminum and brass mountings, as shown above. See Price-List, Nos. 770-772.

Our chain-tapes are U. S. Standard measure at 62° Fahrenheit and with ten pounds strain.

METALLIC TAPES.

These are of linen, about five-eighths of an inch wide, and have fine brass wires interwoven through their whole length. They are thus measurably correct, even when wet.

They are graduated in feet and tenths of feet or in feet and inches, on one side, as ordered, and are also marked in links on the reverse side. They are wound up in a leather case having a folding handle. See Price-List, Nos. 780-794.

STEEL TAPES.

The best tapes are made of a thin ribbon of steel in one piece, of straight spring-temper, and either one-quarter, three-eighths, or one-half of an inch wide.

These tapes are of all lengths from twenty-five to one hundred feet, graduated into feet and inches, and links on the reverse side, or, more usually, feet and tenths of a foot, and links on the reverse side, the figures and graduations being raised on the surface of the steel.

American steel tapes (Paine's pattern) are made of thin steel ribbon, straight spring-temper, in one piece, and about one-quarter of an inch wide. They can be detached from the case when desired, and used with a pair of handles with compensation-scale for variations of temperature, for chain measurements.

These tapes are U. S. Standard measure at 62° Fahrenheit, and using about twelve pounds strain. A hundred foot tape expands .0756 inch for each 10° rise in temperature.

The tapes are wound up in a leather or metal case, having a folding handle. See Price-List, Nos. 800-835.

Our Excelsior steel tape, one-half inch wide and mounted on an open brass frame with folding handle, is well liked for use in mines.

The tape is easily wound up and unwound, and the open frame allows moisture to evaporate. See Price-List, Nos. 850-858.

METRIC AND VARA TAPES.

When desired, we can furnish any of our metallic tapes, Nos. 780-794, and steel tapes, Nos. 820-835, with metric or vara measure on the reverse side, instead of links, at extra prices, as quoted on pages 279 and 281; and with metric or vara measure only, at prices of regular styles of similar lengths in feet. Our chain-tapes, Nos. 760-772, are also graduated with metric measure only (when so ordered), and are marked at each meter with the first and last meter in

decimeters. If graduated with vara measure only, they are marked at each vara with the first and last vara in tenths.

INFORMATION TO PURCHASERS.

SELECTION OF INSTRUMENTS.

FOR original surveys, or ascertaining the bearing of lines in the preparation of county maps, the PLAIN COMPASS will answer.

The VERNIER COMPASS, or VERNIER TRANSIT-COMPASS, will be required where allowance must be made for the variation of the needle, as in retracing the lines of an old survey.

When local attraction must be taken into account, in addition to the variation of the needle, and angles taken independently of the needle, an instrument with a graduated limb must be used, and for this purpose the RAILROAD COMPASS will be sufficient.

For a mixed practice of general surveying, including farm and city work, the establishment of grades of roads and the running of levels, such an instrument as the SURVEYORS' TRANSIT, with its various attachments, is amply sufficient.

The various forms of the ENGINEERS' TRANSIT, the MOUNTAIN TRANSIT, and the Y-LEVELING-INSTRUMENTS, are designed for engineering of the highest class.

In the U. S. Public Land surveys, an instrument with Solar Attachment is required, and the SOLAR TRANSIT is usually selected.

In surveys of mining claims, especially in high elevations, and for the surveys of mines in general, the MOUNTAIN TRANSIT, with the Solar Attachment and with other extras, has proved a universal favorite.

The various PLANE-TABLE outfits have a recognized utility for topographical and map drawing.

The CURRENT-METERS are almost indispensable in measuring the velocity of the flow of water in harbors, rivers, small streams and irrigation ditches.

The DRAINAGE LEVEL is, we believe, the most simple and efficient instrument designed for laying out drains and similar work.

The ARCHITECTS' LEVEL and the BUILDERS' TRANSIT are used in laying out buildings, determining the level of their floors, sills and windows, and in the general work of the builder.

The EXPLORERS' TRANSIT, the RECONNOISSANCE TRANSIT, and the various forms of POCKET COMPASSES, with or without telescopic attachment, are very desirable for a large class of work where extreme lightness and portability are desirable.

Where iron ores are to be traced, the MINERS' DIP-COMPASS, the DIAL COMPASS and the POCKET SOLAR COMPASS are used. We do not pretend to make any instrument by which veins of gold and silver can be traced, or the presence of these metals detected.

Our instruments are not carried in stock by merchants, and we do not deem it advisable to add to our prices in order to enable us to give to merchants a large discount, which, of course, would be paid by the purchaser.

WARRANTY.

All our instruments are examined and tested by us in person, and are sent to the purchaser adjusted and ready for immediate use.

When purchased directly from us, they are warranted correct in all their parts, — we agreeing, in the event of any defect appearing after reasonable use, to repair or replace

with a new and perfect instrument, promptly and at our own cost, express charges included ; or we will refund the money and the express charges paid by the customer.

Instances sometimes occur, in a business as large and widely extended as ours, where, owing to careless transportation or to defects escaping the closest scrutiny of the maker, instruments reach our customers in bad condition. We consider the retention of such instruments in all cases an injury very much greater to us than to the customer himself.

TRIAL OF INSTRUMENTS.

It may happen that this statement will come into the hands of those who are entirely unacquainted with us or the quality of our work, and who therefore feel unwilling to purchase an instrument of the excellence of which they are not perfectly assured.

To such we make the following proposition : If requested to do so, we will send the instrument to the express station nearest the purchaser, and direct the Express Agent, on delivery, to collect our bill, together with the charges for transportation, and hold the money on deposit one or two weeks, if desired, until the purchaser shall have had an actual trial of the instrument.

If not found as represented, the purchaser may return the instrument before the expiration of the specified time, and receive the money paid in full, including express charges, and direct the instrument to be returned to us.

This privilege of trial applies only to our larger Transits, Levels and Compasses, and is not given unless requested, and is allowed only in the United States.

EXTENT OF OUR BUSINESS.

Thousands of our instruments are now in use in North and South America, and in many other countries.

Our facilities for manufacturing, which for many years have been far superior to those of any other similar establishment, are constantly being increased by the introduction of new machinery and tools.

We make under our own roof the lenses for the telescopes of our instruments, the glass vials for the level-tubes, the wooden boxes in which the instruments are packed, the leather cases and straps for these boxes, as well as all the metal parts of the instruments themselves.

LOW PRICE OF OUR INSTRUMENTS.

It is often stated that it is impossible to make first-rate instruments at our prices, which are far below those of other skillful manufacturers. To this we can only reply that a visit to our works and a comparison of our facilities with those of any manufacturer will dispel all doubts as to our ability to furnish the best instruments for the money that can be produced in this country.

PACKING.

Each of our Transits, Levels and Surveyors' Compasses is packed in a well-finished mahogany case, furnished with lock and key and brass hooks, and leather strap for convenience in carrying. Each case is provided with screw-driver, adjusting-pin and wrench for center-pin, and, if accompanied by a tripod, with a brass plummet. With all the instruments used for taking angles without the needle, a reading-glass is also furnished.

Unless the purchaser is already supplied, each instrument is accompanied by our Manual, giving full instruction for such adjustments and repairs as are possible to one not provided with the facilities of an instrument-maker.

When sent to the purchaser, the mahogany cases are

carefully enclosed in outside packing-boxes of pine, made a little larger on all sides to allow the introduction of elastic material ; and so effectually are our instruments protected by these precautions, that of many thousands sent out since 1846, in all seasons, by every mode of transportation, and to all parts of the world, very few have sustained any serious injury.

Instruments packed for foreign shipment, which are to have ocean passage, are hermetically sealed in tin cases.

MEANS OF TRANSPORTATION.

Instruments can be sent by express to almost every town in the United States, Canada, and Mexico, regular agents being located at all the more important points, by whom they are forwarded to smaller places by stage.

The charges for transportation are in all cases to be borne by the purchaser, we guaranteeing the safe arrival of our instruments at his express-office, and holding the Express Company responsible to us for all loss and damage on the way.

FINISH OF INSTRUMENTS.

All instruments are covered with a lacquer applied when the work is heated. As long as this lacquer remains, the brass surface will be kept from tarnishing, and the engineer, by taking care not to rub his instrument with a dusty cloth or to expose it to the friction of his clothes, can preserve its original freshness for a long time.

Instead of the ordinary brass finish, most engineers prefer instruments blackened or bronzed. This is done with an acid preparation, after the work has been polished, and gives the instrument a very showy appearance, besides being advantageous on account of not reflecting the rays of the sun as much as the bright or brass finish.

If no direction is given, we usually send Transits, Levels, and Solar instruments of bronze finish, and Compasses of bright finish.

TERMS OF PAYMENT.

Our terms of payment are uniformly cash, and we have but one price, whether ordered in person, by mail or telegraph. Our prices are as low as instruments of first quality can be made.

Remittances may be made by a cashier's draft payable to our order, which can be procured from banks or bankers in almost all the larger villages, or by Express Company or Post-office money-orders. These may be sent by mail with the order for the instrument, and if lost or stolen on the way can be replaced by a duplicate obtained as before, without additional cost. The customer may also send the money in advance by registered mail or by the express agent, or may pay the agent on receipt of the instrument in funds current in New York.

Customers ordering instruments and desiring changes in construction from our regular patterns must make a payment in advance, when ordering, of fifty per cent. of the price.

The cost of returning the money on bills of amounts under \$20, collected by express, will be charged to the customer.

When articles are to be sent by mail, payment must be made in advance, including the cost of postage. The postage required is mentioned in the second column of the Price-List.

INSTRUMENTS FOR FOREIGN COUNTRIES.

We send Civil Engineers' and Surveyors' instruments to Canada, Mexico, Central America, Cuba, South America,

China, Japan, Australia, Africa, and India, as well as to various parts of Europe.

The cash for all orders for foreign shipments by steamship must, in every case, accompany the order, and if it is desired that we attend to the shipment of the instruments, the remittance must be made ten per cent. more than the catalogue price of the instruments if the order amounts to \$250 or less, or eight per cent. more than the catalogue price if the order amounts to from \$300 to \$500, or six per cent. more than the catalogue price if the order amounts to from \$600 to \$1,000. This extra remittance is to cover cost of shipping charges, freight and insurance, which must always be paid in advance on all shipments except those to Canada and some parts of Mexico.

If the amount remitted is more than enough to cover these expenses, any balance will be returned to the purchaser with the receipted bill and bill of lading, unless we are directed to hold it to his credit and subject to his order.

Remittances must be made by bankers' draft on London, England, or on New York City, and such drafts can be purchased in any of the large cities of the countries named.

When telegraphing cable messages to us, use either the Western Union or the Lieber Code.

ALUMINUM.

Since 1876 we have been making Civil Engineers' and Surveyors' instruments of aluminum, to order only. The only advantage which instruments of aluminum have over those of the ordinary metals is their light weight; but as all the bearing parts must be made of bronze, the total weight can be reduced only about fifty per cent. We finish our aluminum instruments in the natural color, and the

result is more satisfactory from an artistic standpoint than when an artificial coloring is used, although it entails much extra expense. We will quote prices on application for any of our instruments of regular pattern made of aluminum.

REPAIR OF INSTRUMENTS.

Every year we receive a thousand, or more, instruments of our own and others' make, sent to us for refitting and repairs. Most of them have been injured by falls, many have parts worn and defective after long use; and others are sent for repolishing and renovating.

The injuries are usually more serious than is apparent to the owner, and the full extent of the injury can be known only by an examination as the instrument is taken apart.

We advise our customers who have instruments in need of repairs to send them directly to us, as our facilities enable us to do the work much more economically and promptly than any other maker, however accessible.

The instruments should always, when practicable, be placed in their own boxes, and then enclosed in an outside packing case, an inch larger in all its dimensions, that the space between the two may be filled with paper wadding, hay or fine shavings. THE OWNER'S NAME AND ADDRESS should always appear on the package, and a note specifying the repairs needed should always accompany the instrument, and a letter should also be sent to us by mail, giving not only directions as to the repairs, but also stating when the return of the instrument is desired, and the address to which it should be forwarded.

It should also be remembered that each instrument is made to fit its own spindle, and no other; and therefore this part, with the leveling-head, if it has one, should always be sent with it. The tripod legs and the head in

which they are inserted need not be sent, unless in need of repairs. When requested to do so, we will send an estimate of the cost of repairs on any instrument sent us before beginning the work.

Compasses come to us with the plates sprung, the sights bent or broken, the glass or level-vials fractured, and the **REPAIRS TO** pivot so dulled as to render the needle sluggish and unreliable. The cost of repairing these defects ranges from \$2 to \$10. A pair of new sights fitted costs \$5; a new needle with jeweled-center and pivot complete, \$3; a new jeweled-center only, \$1.50; regrounding compass-circle, \$5. The Compass should always be accompanied with the ball-spindle, and if a new ball-spindle is required, the whole instrument, or at least the socket in which the spindle fits, should be forwarded to us. A new ball-spindle, fitted, costs \$2. See, also, page 252.

Repairs to Railroad Compasses cost from \$10 to \$20, and to Solar Compasses from \$20 to \$50; and regrounding the horizontal limb and vernier to read to one minute, costs \$10.

The injuries which Engineers' and Surveyors' Transits sustain by falls are usually much more serious; the plates, **REPAIRS TO** standards and cross-bars of telescopes are **TRANSITS.** often bent, and sockets or centers are usually so deranged as to be entirely useless.

The cost of repairing an instrument with such injuries ranges from \$10 to \$30, or even \$50, new sockets alone costing from \$15 to \$20. See, also, page 252

Variation plate added to an Engineers' Transit sent for repairs, costs.....	\$15.00
Regrounding horizontal limb and vernier to read to one minute, costs	10.00
Regrounding vertical limb and vernier to read to one minute, costs.....	5.00

No one but a workman with practised hand and provided with the best facilities can properly set the platinum **PLATINUM** wires in a cross-wire diaphragm, and it is **CROSS-WIRES.** useless, therefore, for us to send a parcel of wires for that purpose.

The only way in which they can be replaced without sending the telescope to us is to take out the ring and send it, with its screws, washers, etc., and we will return it with the wires, properly secured.

Plain platinum cross-wires, replaced on the old ring,	
cost	\$2.00
Adjustable platinum stadia-wires, replaced on the old	
ring, cost	3.00
Fixed platinum stadia-wires, replaced on the old ring,	
cost	5.00

If sent by mail, add 15 cents for postage and registry, and 25 cents for a safety brass packing-box.

We are not responsible for wires sent in this way and broken while inserting the ring in the telescope. The best plan is to send us the telescope when new cross-wires are needed.

When it is desirable to substitute platinum for spider-web, a new ring with screws will be required, and the telescope should be sent to us.

Plain platinum cross-wires, with diaphragm, screws,	
etc., cost	\$3.00
Adjustable platinum stadia-wires, with diaphragm,	
screws, etc., cost	5.00
Fixed platinum stadia-wires, with diaphragm, screws,	
etc., cost	7.00

(See, also, pages 9-11.)

Leveling-instruments are generally much less injured **REPAIRS TO** by falls than Transits. The damages are **LEVELS.** usually the bending of the bar, the springing of the sockets, and the breaking of the vial.

The cost of repairs varies from \$5 to \$20 ; a new level-vial set in the old tube costs \$1.25 to \$2 50, according to size of the Level. See, also, page 253.

REPOLISHING The cost of repolishing an instrument
INSTRUMENTS. varies, but may be stated generally as follows :

COMPASSES, Plain and Vernier.....	\$ 5.00 to \$ 7.00
RAILROAD COMPASSES	8.00 to 10 00
SOLAR COMPASSES, large size	12 00 to 15.00
TRANSITS.....	12 00 to 15.00
Y-LEVELS.....	8.00 to 12 00

It must be understood that these prices are in addition to the cost of adjustment and of any necessary repairs.

No additional charge is made for bronzing or blackening an instrument when repolished.

Payment for repairs may be made at the Express-Office where the instrument is received, the customer paying for the first transportation of the instrument to us or not, as he may prefer. Whenever the charges are paid in advance the express receipt should be mailed directly to us.

Chain tallies, per set of 950	.06

SPECIAL NOTICE.

A Transit with "plain" telescope is one *without* any attachments or extras, such as the clamp and tangent, vertical circle and level.

The telescopes of all our Transits, Nos. 1 to 17, 25 to 90, and Nos 110 to 117, are now furnished with rack and pinion movements to both eyepiece and object-glass slides without extra charge.

In Transits Nos. 20, 100, 102, and 105, the object-glass is focused by a rack and pinion and the eyepiece by a spiral movement.

To enable the observer to see objects near the instrument, we have recently introduced an important modification of the telescopes used on Transits Nos. 1 to 117, so that they can be focused on an object at a distance of about four and one-half feet from the instrument.

All of our transits, Nos. 1 to 105, are furnished with shifting center to the leveling-head, and with a tripod and leveling-screws and clamp and tangent to spindle. Transits Nos. 20, 25 to 31, 100 and 102 have tripods with extension legs. For prices of plain, split-leg, and extension tripods see pages 266 and 267.

The limbs of all of our Transits, Nos. 1 to 102, are graduated on sterling silver. The graduation is to half degrees, and is read by vernier to single minutes. A finer graduation is furnished, if desired, at an extra price. See page 261.

The vertical circles and vertical arcs are also graduated on sterling silver. The circle of $3\frac{1}{2}$ -inch diameter is graduated to whole degrees and is read by vernier to 5 minutes. The circle of $4\frac{1}{2}$ -inch diameter and the arc of $2\frac{1}{2}$ -inch radius are graduated to half degrees and are read by vernier to 1 minute. The arc of 3-inch radius is graduated to 20 minutes and is read by vernier to 30 seconds.

A variation arc furnished with any new Engineers' Transit, Nos. 1 to 16, costs extra, \$4.00. See No. 130, page 260.

All of our Transits, Nos. 17, 20, 25 to 102, and 110 to 117, have a variation arc for setting off the variation of the needle.

A leveling-tripod head with plates, leveling-screws and clamp and tangent movement, fitted to Vernier Transits, costs extra, \$13.00. See No 176, pages 123 and 261.

Stadia wires are furnished without extra charge if requested when ordering a new Transit, Nos. 1 to 117. When desired, we arrange the stadia wires to disappear, or be out of focus, when the plain cross-wires only are in use. See pages 10, 11, 250, 252, and 253.

A dust guard to the object-glass slide is furnished without charge if requested when ordering a new Transit, Nos. 1 to 90 and 110 to 117; but, if furnished with a new Transit, Nos. 100, 102, and 105, the extra cost is \$4 00. See pages 12, 152, and 261

Reflectors to the limb verniers are furnished without charge, if requested, with new Transits Nos. 1 to 90; but, if furnished with a new Transit, Nos. 100 to 102, the extra cost is \$1.50.

Each Transit is packed in a mahogany case, with lock and leather strap, and has a plummet, reading-glass, adjusting pins, etc. The wood box for the Explorers' Transit is leather covered. The box for the Mountain Transit has an outside sole-leather case with shoulder straps.

PRICE-LIST.

THIRTY-EIGHTH EDITION

TROY, N Y , U. S. A , AUGUST, 1905.

ALL PRICES IN THIS WORK ARE IN U S. CURRENCY STATE WHAT EDITION OF
MANUAL WHEN ORDERING GOODS, AND GIVE CATALOGUE NUMBER

This Price-List supersedes all previous Editions.

ENGINEERS' TRANSITS.

No.		PRICE.
1.	Engineers' Transit, two verniers to limb, 4-inch needle, plain telescope.....	\$145.00
2.	Engineers' Transit, two verniers to limb, 4-inch needle, with level on telescope and clamp and tangent to telescope axis.....	163.00
3.	Engineers' Transit two verniers to limb, 4-inch needle, with $4\frac{1}{2}$ -inch vertical circle, level on telescope and clamp and tangent to telescope axis.....	175.00
6.	Engineers' Transit, two verniers to limb, $4\frac{1}{2}$ -inch needle, plain telescope.....	150.00
7.	Engineers' Transit, two verniers to limb, $4\frac{1}{2}$ -inch needle, with level on telescope and clamp and tangent to telescope axis.....	168.00
8.	Engineers' Transit, two verniers to limb, $4\frac{1}{2}$ -inch needle, with $4\frac{1}{2}$ -inch vertical circle, level on telescope and clamp and tangent to telescope axis.....	180.00
9.	Engineers' Transit, two verniers to limb, $4\frac{1}{2}$ -inch needle, with vertical arc of 3 inches radius and vernier moved by tangent screw, level on telescope and clamp and tangent to telescope axis.....	186.00
10	Engineers' Transit, two verniers to limb, $4\frac{1}{2}$ -inch needle, with vertical arc of 3 inches radius and vernier moved by tangent screw, level on telescope and gradienter combined with clamp and tangent to telescope axis.....	198.00
12.	Engineers' Transit, two verniers to limb, 5-inch needle, plain telescope, as shown on page 6.....	150.00
13.	Engineers' Transit, two verniers to limb, 5-inch needle, with level on telescope and clamp and tangent to telescope axis.....	168.00
14.	Engineers' Transit, two verniers to limb, 5-inch needle, with $4\frac{1}{2}$ -inch vertical circle, level on telescope and clamp and tangent to telescope axis.....	180.00

ENGINEERS' TRANSITS.—*Concluded*

No.		PRICE.
15	Engineers' Transit, two verniers to limb, 5-inch needle, with vertical arc of 3 inches radius and vernier moved by tangent screw, level on telescope and clamp and tangent to telescope axis.	\$186 00
16	Engineers' Transit, two verniers to limb, 5-inch needle, with vertical arc of 3 inches radius and vernier moved by tangent screw, level on telescope and gradienter combined with clamp and tangent, as shown on page 26... .	198.00
17	Engineers' Transit, two verniers to limb, 5-inch needle, with variation arc, Solar Attachment, vertical arc of 3 inches radius and vernier moved by tangent screw, level on telescope, and clamp and tangent to telescope axis, as shown on page 28.....	250.00

EXPLORERS' TRANSIT.

20.	Explorers' Transit, two verniers to limb, 2 $\frac{3}{4}$ -inch needle, with variation arc, 4-inch vertical circle, level on telescope and clamp and tangent to telescope axis, extension tripod with jointed legs Instrument is packed in a mahogany case with leather cover and shoulder strap.... .	\$165.00
-----	--	----------

(An illustrated descriptive circular mailed on application)

LIGHT MOUNTAIN AND MINING TRANSITS.

25.	Light Mountain Transit, two verniers to limb, 4-inch needle, with variation arc, telescope of finest quality, power 20 diameters, extension tripod shortening to half length. The instrument is packed in a mahogany case, covered with a light sole-leather case, with straps for "packing." With plain telescope.....	\$150.00
26.	Light Mountain Transit, with level on telescope and clamp and tangent to telescope axis ...	168.00
27.	Light Mountain Transit, with 4 $\frac{1}{2}$ -inch vertical circle, level on telescope and clamp and tangent to telescope axis	180.00
28.	Light Mountain Transit, with vertical arc of 2 $\frac{1}{2}$ inches radius and vernier moved by tangent screw, level on telescope and clamp and tangent to telescope axis.....	186.00
29.	Light Mountain Transit, with vertical arc of 2 $\frac{1}{2}$ inches radius and vernier moved by tangent screw, level on telescope and gradienter combined with clamp and tangent... .	198.00
30.	Light Mountain Transit, with Solar Attachment, vertical arc of 2 $\frac{1}{2}$ inches radius and vernier moved by tangent screw, level on telescope and clamp and tangent to telescope axis, as shown on page 31.....	245.00
31.	Light Mountain Transit, with Solar Attachment, Jones' latitude arc complete, level on telescope and clamp and tangent to telescope axis. See page 83.....	300.00

SURVEYORS' TRANSITS.

No.	(WITH TWO VERNIERS TO LIMB.)	PRICE
35.	Surveyors' Transit, two verniers to limb, 4-inch needle, plain telescope.	\$125.00
36.	Surveyors' Transit, two verniers to limb, 4-inch needle, with level on telescope and clamp and tangent to telescope axis.	143.00
37.	Surveyors' Transit, two verniers to limb, 4-inch needle, with $4\frac{1}{2}$ -inch vertical circle, level on telescope and clamp and tangent to telescope axis.	155.00
45.	Surveyors' Transit, two verniers to limb, 5-inch needle, plain telescope.	130.00
46.	Surveyors' Transit, two verniers to limb, 5-inch needle, with level on telescope and clamp and tangent to telescope axis.	148.00
47.	Surveyors' Transit, two verniers to limb, 5-inch needle, with $4\frac{1}{2}$ -inch vertical circle, level on telescope and clamp and tangent to telescope axis, as shown on page 84.	160.00
48.	Surveyors' Transit, two verniers to limb, 5-inch needle, with $4\frac{1}{2}$ -inch vertical circle, level on telescope and gradient combined with clamp and tangent to telescope axis.	172.00
55.	Surveyors' Transit, same as No. 45, but with $5\frac{1}{2}$ -inch needle.	130.00
56.	Surveyors' Transit, same as No. 46, but with $5\frac{1}{2}$ -inch needle.	148.00
57.	Surveyors' Transit, same as No. 47, but with $5\frac{1}{2}$ -inch needle.	160.00
58.	Surveyors' Transit, same as No. 48, but with $5\frac{1}{2}$ -inch needle.	172.00
60.	Surveyors' Transit, two verniers to limb, 5-inch needle, with Solar Attachment, vertical arc of 3 inches radius and vernier moved by tangent screw, level on telescope and clamp and tangent to telescope axis, as shown on page 41.	226.00

SURVEYORS' TRANSITS.

No.	(WITH ONE VERNIER TO LIMB)	PRICE.
65.	Surveyors' Transit, one vernier to limb, 4-inch needle, plain telescope.....	\$110.00
66.	Surveyors' Transit, one vernier to limb, 4-inch needle, with level on telescope and clamp and tangent to telescope axis.....	128.00
67.	Surveyors' Transit, one vernier to limb, 4-inch needle, with $4\frac{1}{2}$ -inch vertical circle, level on telescope and clamp and tangent to telescope axis.....	140.00
75.	Surveyors' Transit, one vernier to limb, 5-inch needle, plain telescope.....	115.00
76.	Surveyors' Transit, one vernier to limb, 5-inch needle, with level on telescope and clamp and tangent to telescope axis, as shown on page 38.....	133.00
77.	Surveyors' Transit, one vernier to limb, 5-inch needle, with $4\frac{1}{2}$ -inch vertical circle, level on telescope and clamp and tangent to telescope axis	145.00
78.	Surveyors' Transit, one vernier to limb, 5-inch needle, with $4\frac{1}{2}$ -inch vertical circle, level on telescope and gradienter combined with clamp and tangent to telescope axis	157.00
85.	Surveyors' Transit, same as No. 75, but with $5\frac{1}{2}$ -inch needle.....	115.00
86.	Surveyors' Transit, same as No. 76, but with $5\frac{1}{2}$ -inch needle.....	133.00
87.	Surveyors' Transit, same as No. 77, but with $5\frac{1}{2}$ -inch needle.....	145.00
88.	Surveyors' Transit, same as No. 78, but with $5\frac{1}{2}$ -inch needle.....	157 00
90.	Surveyors' Transit, one vernier to limb, 5-inch needle, with Solar Attachment, vertical arc of 3 inches radius and vernier moved by tangent screw, level on telescope and clamp and tangent to telescope axis, as shown on page 41	211.00

RECONNOISSANCE TRANSIT.

100.	Reconnaissance Transit, one vernier to limb, $3\frac{1}{2}$ -inch needle, with $3\frac{1}{2}$ -inch vertical circle, level on telescope and clamp and tangent to telescope axis, leveling-screws and clamp and tangent to spindle, and extension tripod, as shown on page 43.....	\$115.00
102.	Reconnaissance Transit, same as No. 100, but with $4\frac{1}{2}$ -inch vertical circle and vernier reading to one minute..	122.00

BUILDERS' TRANSIT.

No.		PRICE
105.	Builders' Transit, with level on telescope, clamp and tangent to telescope axis and to limb and spindle, and with leveling-screws and tripod, as shown on page 45.....	\$80.00

VERNIER TRANSIT-COMPASSSES.

110.	Vernier Transit, 5-inch needle, plain telescope, compass tripod	\$70.00
111.	Vernier Transit, 5-inch needle, with level on telescope and clamp and tangent to telescope axis	88.00
112.	Vernier Transit, 5-inch needle, with $3\frac{1}{2}$ -inch vertical circle, level on telescope and clamp and tangent to telescope axis	96.00
115.	Vernier Transit, 6-inch needle, plain telescope, compass tripod.	75.00
116.	Vernier Transit, 6-inch needle, with level on telescope and clamp and tangent to telescope axis	93.00
117.	Vernier Transit, 6-inch needle, with $3\frac{1}{2}$ -inch vertical circle, level on telescope, and clamp and tangent to telescope axis, as shown on page 47.....	101.00

ATTACHMENTS AND EXTRAS FOR TRANSITS.

	PRICE.	POST.
130. Variation Arc added to any new Engineers' Transit, Nos. 1 to 16, if ordered with the Transit	\$ 4.00	
131. Variation Arc added to Transits when sent for repairs.....	15.00	
135. Vertical Circle, $3\frac{1}{2}$ inches diameter, with vernier to 5 minutes, see pages 49 and 51.	8.00	\$0.15
136. Vertical Circle, 4 $\frac{1}{2}$ inches diameter, with vernier to 1 minute, see page 49... ..	12 00	.20
137. Vertical Circle, 5 inches diameter, with vernier to 1 minute	15 00	.20
138. Vertical Circle, 5 inches diameter, with two opposite double verniers to 1 minute, see page 50	35.00	.35
139. Vertical Arc, 2 $\frac{1}{2}$ inches radius, with vernier to 1 minute moved by tangent screw, see page 52.....	18 00	.20
140. Vertical Arc, 3 inches radius, with vernier to 30 seconds moved by tangent screw, see page 52. ...	18 00	.20
141. Aluminum Guard for Vertical Circle, see page 51. ...	6.00	
145. Level on Telescope with ground vial and scale, see page 53.....	12.00	.25
148. Clamp and Tangent to telescope axis, see page 53...	6.00	.13
150. Gradienter combined with clamp and tangent, see page 56.....	18.00	.25

ATTACHMENTS AND EXTRAS FOR TRANSITS.—*Concluded.*

No.		PRICE.	Post
151.	Platinum Stadia wires, adjustable, and diaphragm...	\$ 5.00	\$ 0.15
152.	Platinum Stadia wires, fixed, and diaphragm.....	7.00	.15
154.	Dust-Guard to object-glass slide, see page 12.....	4.00	
155.	Rack and Pinion movement to eyepiece	5.00	
157.	Sights on Telescope with folding joints, see page 54	8.00	
158.	Sights on Standards at right angles with telescope, see page 55	8.00	
160.	Detachable Side Telescope and Counterpoise, for vertical sighting, see page 58.	25.00	.50
161.	Detachable Riding Telescope, for vertical sighting, see page 58.....	25.00	.50
165.	Reflector for illuminating cross-wires, see page 59...	4.00	.15
166.	Reflector for illuminating cross-wires of large Y-Level	5 00	.15
168.	Diagonal Prism for eyepiece of telescope, see page 59	8 00	.15
170.	Plummet-Lamp for Mine-Engineering, see page 60..	10.00	.35
173.	Quick-Leveling Attachment	6.00	.35
174.	Quick-Leveling Attachment, if ordered with any new Transit Nos 1 to 105	5.00	
176.	Leveling-Head with plates, leveling screws and clamp and tangent, fitted to Transits Nos. 110 to 117, see page 123	13.00	
180.	Attached Magnifier with three universal joints, to read verniers, each	5.00	
185.	Graduation of limb to read to 20 or 30 seconds, extra	10.00	
186.	Graduation of limb to read to 10 seconds, extra.....	30.00	
187.	Graduation of 4½ or 5-inch vertical circle to read to 20 or 30 seconds, extra.....	5.00	
190.	Solar attachment with declination arc, hour-circle and polar-axis, see page 61.....	60.00	.30
192.	Solar Screen to fit eyepiece of telescope, see page 81	5.00	.12
193.	Patent Latitude-Level, for use with Solar Transit, see page 82.....	6.00	.15
195.	Jones' Latitude Arc, with reversible level, see page 83.....	73.00	
196.	Striding or Adjusting-Level, see page 86.....	3.00	.15

NOTE.—For Tripods, see pages 176-179 and 266 and 267. For
Leather Cases, see pages 180 and 268

SOLAR COMPASS.

PRICE.

210.	Burt's Solar Compass, with leveling screws and clamp and tangent to spindle, and tripod, see page 99.....	\$210.00
------	--	----------

NOTE.—For Pocket Solar Compass, see No. 275, and pages 132 and 263

RAILROAD COMPASSES.

No.		PRICE.
215.	Railroad Compass, two verniers to limb, limb reading to 1 minute, 5-inch needle, brass cover, outkeeper and staff mountings.	\$70.00
216.	Railroad Compass, two verniers to limb, limb reading to 1 minute, 5½-inch needle, brass cover, outkeeper and staff mountings, see page 104... ..	75.00
220.	Railroad Compass, one vernier to limb, limb reading to 1 minute, 5½-inch needle, brass cover, outkeeper and staff mountings, see page 107.....	60.00

These Compasses should always be used on a tripod when practicable. Tripods Nos. 415, 420 and 425 are adapted for use with these Compasses.

VERNIER COMPASSES.

225.	Vernier Compass, 4-inch needle, brass cover, outkeeper and staff mountings.. ..	\$30.00
226.	Vernier Compass, 5-inch needle, brass cover, outkeeper and staff mountings	35.00
227.	Vernier Compass, 6-inch needle, brass cover, outkeeper and staff mountings, see page 110.....	40.00

PLAIN COMPASSES.

230.	Plain Compass, 4-inch needle, brass cover, outkeeper and staff mountings.....	\$25.00
231.	Plain Compass, 5-inch needle, brass cover, outkeeper and staff mountings.....	30.00
232.	Plain Compass, 6-inch needle, brass cover, outkeeper and staff mountings, see page 121.....	35.00

NOTE.—Compasses Nos 210 to 232 are packed in mahogany case, with lock and leather strap. A Compass Tripod (our No 415) will be furnished with any of these Compasses, Nos 215-232, at an extra cost of \$5 00, and if the staff mountings are omitted we deduct \$2 00.

ATTACHMENTS AND EXTRAS FOR COMPASSES.

	PRICE	Post.
240. Compound Tangent Ball-Spindle, see page 122.....	\$ 7.00	\$0.30
241. Leveling-Adopter, large size, see page 122.....	7.00	.40
242. Leveling-Head with plates, leveling-screws and clamp and tangent, fitted to use with tripods Nos. 401, 406, 411, 415, 420 and 425, see page 123	13.00	
245. Compass Tripod Mountings, without the legs.....	4.00	.60

NOTE.—For Tripods, see pages 176-179 and 266 and 267. For Leather Cases, see pages 180 and 268.

TELESCOPIC SIGHT. (Patented.)

ATTACHABLE TO COMPASS SIGHT. See pages 124-130.

No.		PRICE.	Post.
260.	Achromatic Telescope, 9-inch, power about 12 diameters.....	\$15.00	\$0.45
261.	Achromatic Telescope, 9-inch, larger object-glass, power about 20 diameters, see page 124.....	17.00	.45
262.	Achromatic Telescope, 9-inch, same as No. 261, and with stadia wires.....	20.00	.50

We add to the Telescope Sight the following extras, at prices named :

265.	Vertical Circle, with vernier to 5 minutes	5.00	
266.	Level on Telescope, with ground and graduated vial	5.00	
267.	Clamp and Tangent to telescope axis.....	5.00	
268.	Offset-standard with counterpoise, to bring the telescope over the line of zeros.....	7.50	.50

POCKET SOLAR COMPASS.

275.	Pocket Solar Compass, one vernier to limb, limb reading to 1 minute, 3-inch needle, with two levels, folding sights and staff mountings, see page 132...	\$100.00
276.	Pocket Solar Compass, with light tripod.....	105.00
277.	Pocket Solar Compass, with light extension tripod...	110.00
278.	Pocket Solar Compass, with light extension tripod and leveling-head with clamp and tangent.....	120.00
280.	Side Telescope and Counterpoise fitted to new Pocket Solar Compass.....	25.00

POCKET RAILROAD COMPASSES.

285.	Pocket Railroad Compass, one vernier to limb, limb 5 inches diameter reading to 1 minute, and with clamp and tangent, 3½-inch needle, folding sights, two levels and staff mountings, see page 135.....	\$40.00
288.	Pocket Railroad Compass, one vernier to limb with clamp and tangent, limb inside the compass-circle and reading to 1 minute, 4½-inch needle, folding sights, two levels and staff mountings.....	33.00
290.	Pocket Railroad Compass, 4½-inch needle, clamp and tangent to limb, limb reading to 1 minute, clamp and tangent to main spindle or socket, and fitted with our Telescopic Sight No. 260, with the extras of level, vertical circle to 5 minutes, and clamp and tangent to telescope axis, and with tripod	73.00

POCKET RAILROAD COMPASSES.—*Concluded.*

No.		PRICE.	Post.
291.	Pocket Railroad Compass, same as No. 290, but with Telescope No. 261.....	\$75.00	
292.	Pocket Railroad Compass, same as No. 290, but with Telescope No. 262... ..	78.00	
293.	Pocket Railroad Compass, same as No. 292, and with Leveling-Adopter, complete as shown on page 137.....	83.00	

POCKET VERNIER COMPASSES.

300.	Pocket Vernier Compass, $3\frac{1}{2}$ -inch needle, folding sights, two levels and staff mountings, see page 189	\$16.00	\$0.70
305.	Pocket Vernier Compass, $4\frac{1}{2}$ -inch needle, folding sights, two levels and staff mountings, see page 189	18.00	1.10
310.	Pocket Vernier Compass, $4\frac{1}{2}$ -inch needle, clamp and tangent to main spindle or socket, and fitted with our Telescopic Sight No. 260, with extras of level, vertical circle to 5 minutes and clamp and tangent to telescope axis, and with tripod.....	58.00	
311.	Pocket Vernier Compass, same as No. 310, but with Telescope No. 261	60.00	
312.	Pocket Vernier Compass, same as No. 310, but with Telescope No. 262, see page 141.....	63.00	

POCKET PLAIN COMPASSES.

315.	Pocket Plain Compass, $2\frac{1}{2}$ -inch needle and folding sights.	\$ 8.00	\$0.25
316.	Pocket Plain Compass, $2\frac{1}{2}$ -inch needle, folding sights and staff mountings, see page 142.....	10.00	.35
317.	Pocket Plain Compass, $3\frac{1}{2}$ -inch needle and folding sights.....	10 00	.40
318.	Pocket Plain Compass, $3\frac{1}{2}$ -inch needle, folding sights and staff mountings, see page 142... ..	12.00	.50
319.	Pocket Plain Compass, $3\frac{1}{2}$ -inch needle, folding sights, two levels and staff mountings.	13.50	50

EXTRAS FOR POCKET COMPASSES.

325.	Clamp and Tangent fitted to ball-spindle of Compasses Nos. 285, 288, 300, 305, and 315 to 319..	\$ 5.00	
326.	Rack and Pinion to variation arc of Compasses Nos. 288 to 312	4.00	
327.	Leveling-Adopter, small size, see page 142	5.00	\$0.25
328.	Leveling-Head with plates, leveling-screws and clamp and tangent to spindle	10.00	

NOTE.—For Tripods, see pages 176-179 and 267. For Leather Cases, see pages 180 and 268.

GEOLOGISTS' AND CLINOMETER COMPASSES.

No		PRICE	Post.
335.	Geologists' Compass (of Aluminum), graduated movable sighting circle, graduated base, variation arc, folding sights, two levels, clinometer and staff mountings, see page 143.....	\$24.00	\$0.35
338.	Clinometer Compass (of brass), 3½-inch needle, folding sights, square base, two levels, clinometer and staff mountings, see page 144..	16.00	.50

A small light tripod for these compasses costs extra \$5 00.

MINERS' COMPASSES OR DIPPING-NEEDLES.

FOR TRACING VEINS OF MAGNETIC IRON ORE.

340.	Miners' Dip-Compass, 3-inch needle with stop, glass on both sides, in wood case, see page 146...	\$12.00	\$0.25
341.	Miners' Dip-Compass, 3-inch needle with stop, glass on both sides, with brass covers ...	12.00	.35
344.	Miners' Dip-Compass, 3-inch Norwegian needle with stop, glass on both sides, with brass covers, see page 146.....	12.00	.35
345.	Miners' Dip-Compass, 4-inch Norwegian needle with stop, glass on both sides, with brass covers..	15.00	.50

DIAL COMPASSES.

348.	Brass Dial Compass, with hour-circle graduated for any latitude as ordered, variation arc, graduated base, one folding sight, two levels and clinometer, see page 148.....	\$18.00	\$0.40
349.	Dial Compass, same as No. 348, and with staff mountings complete.....	20.50	.50

BRAZED STEEL CHAINS.

670.	33 feet, 50 links, No. 12 tempered steel wire, brazed links and rings.....	\$ 5.00	\$0.45
671.	50 feet, 50 links, No. 12 tempered steel wire, brazed links and rings.....	6.00	.55
672.	66 feet, 100 links, No. 12 tempered steel wire, brazed links and rings.....	9.00	.70
673.	100 feet, 100 links, No. 12 tempered steel wire, brazed links and rings.....	10.00	1.00

Our brazed steel chains displace the ordinary chains wherever they are tried, on account of superior lightness and strength. They are practically the only chains now used in railroad construction.

Chains of two and four poles with 40 and 80 links, same price as chains of 50 and 100 links.

Steel snaps to make full chains into "half chains," without extra charge, if ordered with the chain.

GRUMMAN PATENT STEEL CHAINS.

680.	33 feet, 50 links, No. 15 tempered steel wire, weight 1 lb.....	\$ 5.00	\$0.28

The 50, 100, 200, and 300 feet Chain-Tapes also have the first and last foot in 10ths.

STEEL RIBBON BRIDGE-TAPES.

 $\frac{1}{4}$ INCH WIDE, WITH HANDLES AND EXTRA FINE REELS.

No.		PRICE.
770.	Steel Ribbon, 300 feet, graduated each 5 feet.....	\$13.00
771.	Steel Ribbon, 400 feet, graduated each 5 feet.....	15.00
772.	Steel Ribbon, 500 feet, graduated each 5 feet.....	17.00

Our Bridge-tapes are mounted on substantial wooden reels with aluminum and brass mountings and swivel handle.

These tapes have the first and last 5 feet graduated each foot.

NOTE.—We can also furnish tapes, Nos. 760–772, graduated each meter or each vara. See page 239.

METALLIC TAPES.

Made of linen thread, interwoven with fine brass wire. They are $\frac{3}{8}$ -inch wide, and in leather cases. The graduations are in 10ths or 12ths of a foot, as desired, on one side and in links on the reverse side.

No.		PRICE.	Post.
780.	Metallic Tape, 33 feet, in 10ths or 12ths, and links..	\$2.10	\$0.18
782.	Metallic Tape, 50 feet, in 10ths or 12ths, and links..	2.60	.20

No. 885.

PUNCH AND RIVETER, FOR REPAIRING TAPE-LINES.

This punch cuts a clean hole, in steel tapes of the usual thickness, and the eyelet is then inserted and quickly and neatly riveted. The Punch is $7\frac{3}{4}$ inches long.

No.		PRICE.	Post.
885.	Punch and Riveter, with eyelets.....	\$ 5.00	\$0.30
886.	Extra eyelets (two lengths), two packages of 500 each length.....	1.25	.05

SUPPLEMENT

TO

Thirty-Eighth Edition of Manual.

August, 1905.

. The prices in this Catalogue may vary from time to time, on account of fluctuations in Market Rates.

This Price-List supersedes all previous editions, and has been carefully revised and enlarged.

 When ordering goods always state what edition of Manual, and number in Catalogue

DRAWING-INSTRUMENTS.

TO GUIDE the Surveyor and Engineer in the selection of Drawing-Instruments, we here add a detailed description, with illustrations and prices of the separate pieces and cases of the different kinds in general use.

Those we shall first mention are of Swiss manufacture, of the finest quality and finish, and are made of the best German silver and English steel.

We show first the regular patterns and then those with the celebrated pivot-joint.

The Alteneder instruments are the best of American manufacture, and are equally good with those of Swiss make.

The fine German silver instruments, of German make, are the best of their kind.

The instruments before mentioned are intended for Engineers, Architects, Draftsmen, Machinists and Students in Technical Schools.

The cheaper German silver, brass and nickel-plated instruments are for Common School use and elementary practice.

Parties wanting special cases made up, can select the pieces, and we will make cases to suit, at an additional cost of from \$2 to \$10, according to the size and quality of the cases, which are made of morocco, rosewood, or mahogany.

For prices of regular size cases, see page 294.

For the convenience of our customers, we will furnish any articles not on our list, but described in the catalogue of any American manufacturer or dealer in mathematical instruments, at catalogue prices.

SPECIAL NOTICE.

MANY of our smaller instruments, such as drawing-instruments, pocket-compasses, chains, tapes, small packages of paper and parts of large instruments, can be sent by mail securely packed, and at much lower rates than are charged by Express Companies. Packages not exceeding four pounds in weight can be sent in this way within the United States, Canada and Mexico at a cost of one cent per ounce.

In all cases where goods are to be sent by mail, the cash for postage as well as for the goods must accompany the order.

The postage required is mentioned in the second column of the Price-List, and for articles worth more than one dollar the amount named for postage includes the cost of registry.

All articles can be registered at an extra cost of eight cents for each package besides regular postage. Packages for registry should not exceed four feet in length.

We are not responsible for goods lost or injured when sent by mail.

ALTENEDER'S PATENT JOINT GERMAN SILVER AND STEEL DRAWING-INSTRUMENTS.

(WARRANTED GENUINE.)

The excellence of these instruments consists in the joints of the dividers being so constructed as to prevent any irregular motion when the legs are opened or closed, also for the general care with which the instruments are finished. All the pens are well made and pointed.

METALLIC TRIANGULAR SCALES.

The Metallic Triangular Scales are made of brass tubing with the ends closed, nicked with a dull finish, and weigh about three and one-half ounces.

The liability of the wood scales to crack, warp, or twist, the chipping of their edges, and their variation from standard measurement, are well known to all who have used them. These objections have been overcome in the metallic scale.

1690.	Metallic Triangular Scale, 12-inch, divided same as No. 1656.....	\$2.50	\$0.16
1692.	Metallic Triangular Scale, 12-inch, divided same as No. 1660.....	2.50	.16

SECTION-LINERS.

This Section-Liner is positive in all its motions, being operated by a rack and pinion movement. The rack-rod passes through two heavy weights and is held securely by clamp-screws. Two needle-pointed pins aid to hold the weights in place when necessary. Lines can be drawn at any angle, in any direction, and on any part of the board.

SECTION-LINERS (*Concluded*)

No.		PRICE
2155.	Section-Liner with 12-inch rack and 12-inch blade.....	\$6 50
2156.	Section-Liner with 14-inch rack and 14-inch blade	7 50

Two plain notched wheels are furnished with each instrument for producing 64 and 100 parts to the inch. Extra wheels for either 10, 12, 20, 24, 40, 48 and 50 parts to the inch will be furnished for \$1.50 each. These notched wheels when graduated on the face for ruling and measuring combined will cost \$2 25 each.

(See cut on page 366.)

THE BLUE PROCESS OF COPYING TRACINGS

Special attention is directed to this easy process of copying tracings, and its great value to all Engineers, Architects and Mechanical Draftsmen is fully recognized.

If not convenient to procure a Print-Frame, blue-prints can be made readily by following these directions —

1. Provide a flat board as large as the tracing which is to be copied.
2. Lay on this board a cushion of blanket or felt about $\frac{1}{4}$ -inch thick, to give a slightly yielding backing for the paper
3. Lay on the blanket the prepared paper with the sensitive side uppermost
4. Lay on this paper the tracing, smoothing it out as perfectly as possible, so as to insure a perfect contact with the paper
5. Lay on the tracing a plate of clear glass, which should be heavy enough to press the tracing close down upon the paper. Ordinary plate-glass, one quarter of an inch in thickness, is sufficient.
6. Expose the whole to a clear sunlight by pushing it out on a shelf from a window, or in any other convenient way, from four to six minutes [in winter, six to ten minutes]. If a clear sky only can be had, the exposure must be continued from twenty to thirty minutes; and under a cloudy sky from sixty to ninety minutes may be needed, the shade depending on the time
7. Remove the prepared paper and wash it freely for one or two minutes in clear water, and hang it by one corner to dry.

NOTE — Too light a blue means under-exposure, and too dark a blue is over-exposure

TIN TUBES WITH SCREW TOPS

CONTINUOUS PROFILE-BOOKS.

2715.

These books are for field or office purposes, being printed on a tough thick paper, and mounted upon a continuous piece of muslin and bound in book form with flexible morocco covers, convenient for the pocket. Each page will contain a profile of three thousand feet in length, so that each folio will contain an average section of a road as usually laid out for construction. Railroad and other engineers will find them very useful. The rulings correspond to our large profile-plates A and B.

No.		PRICE.	POST.

No.		PRICE.	Post.
3215.	Brunton Pocket-Transit. Designed for civil and mining engineers, mine managers and geologists. Can be used as a prismatic compass, sighting compass, clinometer and Abney Level. Aluminum case. Size $2\frac{3}{4} \times 2\frac{3}{4} \times 1$ inches. Weight 8 ounces.....	\$25.00	\$0.25
3220.	Pocket Alt-Azimuth, with Telescope, for travelers and military surveyors. Altitudes, azimuths, compass bearings, clinometer degrees and levels are all obtained by this instrument. Size $6\frac{1}{2} \times 2\frac{1}{2} \times 1\frac{1}{2}$ inches, in case.....	50.00	.40

PRISMATIC COMPASSES.

3225.

3225.	Prismatic Compass, $2\frac{1}{2}$ inches diameter, hunting case; can be used as an ordinary compass without opening the cover, and a prismatic compass by raising the cover, glazed with a stout glass, on which is etched a line for the sight. With folding prism and floating card dial with stop.....	15.00	.15
3226.	Prismatic Compass, $3\frac{3}{4}$ inches diameter, with floating metal dial, azimuth glasses, folding prism, folding sight with hinged mirror, ball-joint and staff socket, in morocco case.....	21.50	.25

PRISMATIC COMPASSES.—*Continued.*

No.		PRICE	Post.
3227.	Prismatic Compass, 3 inches diameter, with floating card dial graduated to $\frac{1}{2}$ degrees, folding prism and folding sight (nearly enclosed top), in leather sling case.....	\$16.00	\$0.20

3228.

3228.	Prismatic Compass, 3 inches diameter, with floating metal dial divided to $\frac{1}{2}$ degrees, agate center with stop, folding prism and folding sight (nearly enclosed top not shown in cut), in leather sling case	20.00	.20
3230.	Prismatic Compass, Barker's Patent, 2 $\frac{3}{4}$ -inch floating dial, agate center with stop, mounted beneath 2 $\frac{3}{4}$ -inch pendulum dial, graduated for altitudes 0° to 180°, also graduated 0° to 90° both ways as clinometer and with scale of rise or fall in inches per yard; folding prism and hair sight, metal case, and in leather sling case.....	27.00	.25
3232.	Prismatic Compass, 3 inches diameter, with metal dial graduated to $\frac{1}{2}$ degrees, agate center with stop, folding prism, azimuth glasses, folding sight with hinged and sliding mirror, metal cover, in leather sling case.....	30.00	

SEXTANTS.

No.		PRICE.
3240.	Pocket Sextant graduated to $\frac{1}{2}$ degrees, with vernier to 1 minute, telescope, two neutral glasses, magnifier, tangent screw, etc. In metal box 3 inches diameter, and in leather sling case.	\$42.50
3245.	Sextant of gun-metal, $4\frac{1}{2}$ inches radius, arc of 150° graduated on silver to 15 minutes with vernier to 15 seconds, clamp and tangent and magnifier, one terrestrial telescope, one celestial telescope, one sight-tube, six neutral glasses, two mirrors, in mahogany box.....	50.00
3247.	Sextant of gun-metal, $6\frac{1}{2}$ inches radius, arc of 150° graduated on silver to 10 minutes with vernier to 10 seconds, clamp and tangent and magnifier, two celestial telescopes, one terrestrial telescope, one sight-tube, seven neutral glasses, two mirrors, in mahogany box.....	80.00

3248.

3248. Sextant of gun-metal, superior, 7 inches radius, arc of 150° graduated on silver to 10 minutes with vernier to 10 seconds, clamp and tangent and magnifier, two celestial telescopes, one terrestrial telescope, one sight-tube, seven neutral glasses, two mirrors, in mahogany box.....

100.00

ARTIFICIAL HORIZONS, ANGLE-MIRRORS AND PRISMS. SURVEYORS' CROSS-STAFF HEADS.

No.		PRICE.	Post.
3250.	Artificial Horizon, with black glass plane mounted in brass frame, with three leveling-screws, and sensitive level-vial. All in mahogany box.....	\$16.00	\$0.30
3252.	Mercurial Horizon, iron trough, iron bottle with screw stopper and funnel cap, glazed metal roof. All in mahogany box.....	80.00	

3255.

3260.

3265.

3255.	Angle-Mirror, with small plummet, for angles of 90 degrees. The handle can be detached and stored in frame of instrument. Size, $2\frac{1}{4} \times 2 \times 1\frac{3}{4}$ inches, in morocco case.....	7.50	.15
3256.	Angle-Mirror, plain, for angles of 90°, in morocco case.....	5.00	.15
3260.	Rectangular Prism, for angles of 90°, $2\frac{1}{2} \times 1\frac{1}{4} \times 1\frac{1}{8}$ inches, in morocco case.....	5.00	.12
3262.	Double Prism, to take angles of 90° and 45°, in morocco case.....	10.00	.12
3265.	Surveyor's Cross-Staff Head, for 45° and 90° angles. Octagonal, $2\frac{1}{2}$ inches long. With staff socket.....	2.75	.30
3266.	Surveyor's Cross-Staff Head, for 45° and 90° angles. Octagonal, 3 inches long. With magnetic compass, $1\frac{1}{4}$ -inch needle, and with staff socket.....	4.75	.35
3267.	Surveyor's Cross-Staff Head, for 45° and 90° angles. Round, $3\frac{1}{4}$ inches long. With vertical axis graduated to 1° and vernier to 3 minutes. With magnetic compass, $2\frac{1}{8}$ -inch needle, and with staff socket.....	11.50	.40

PEDOMETERS, PASSOMETERS, TALLY-REGISTER, AND ODOMETER.

3270.

3276.

No.		PRICE.	Post.
3270.	Pedometer, watch form. One dial registers distance walked up to 12 miles by each $\frac{1}{4}$ mile.....	\$4.50	\$0.12
3272.	Pedometer, watch form. Two dials register distance walked up to 50 miles by each 80 yards	5.25	.12
3276.	Passometer, watch form. Three dials register each step up to 25,000 steps, and with stem attachment to set the pointers to zero at will.....	7.50	.12

3280. (See page 400.)

3282.

No.		PRICE.	POST.
3280.	Tally-Register, for surveyors and others; useful in chaining, for counting persons, cattle, coal, wheat, etc. Registers to 999 and can be set to zero at will,	\$2.50	\$0.15
3282.	Veeder Odometer, with fixtures for attaching.....	3.50	.20

This Odometer registers on the dial every fifth revolution of the carriage wheel.

CLINOMETERS.

3284.

(See page 401.)

3288.

CLINOMETERS.

No.		PRICE.	Post.
3284.	Clinometer or Slope-Level (Gurley, maker), 7 inches long, arc to whole degrees, in wood case...	\$8.00	\$0.30
3288.	Clinometer or Slope-Level (Gurley, maker), 6 inches long, arc to whole degrees, two levels, sights and staff mountings, in wood case	16.00	.50
3290.	Boxwood Clinometer, 12-inch, folding to 6-inch, with two levels, compass, inclination scale, and sights, in leather case.....	12.00	.20

The inclination scale gives the value of any angle. The angle, ascertained from the graduated arc, refers to that degree in the column marked "angle," and another column gives the rise or fall in any given distance.

3290.

3292.

3292. Clinometer or Slope-Level, brass frame, 4 inches square, arc to whole degrees and vernier to 5 minutes. The design renders the measurement of the inclination of the under side of a plane available, as any of the four edges may be used ; in case 10.00 .40

ANEROID BAROMETERS.

FOR ASCERTAINING HEIGHTS, DIFFERENCES OF LEVEL AND METEOROLOGICAL CHANGES, APPROACH OF STORMS, ETC.

Mountain Aneroid Barometers, compensated for temperature, with brass cases and silvered dials, in morocco cases.

3303.

No.		PRICE.	Post.
3300.	Pocket Aneroid, 2 inches diameter, altitude scale to 3,000 feet, by each 10 feet.....	\$18.00	\$0.20
3301.	Pocket Aneroid, 2 inches diameter, altitude scale to 5,000 feet, by each 20 feet.....	17.00	.20
3302.	Pocket Aneroid, 2 inches diameter, altitude scale to 10,000 feet, by each 50 feet.....	18.00	.20
3303.	Pocket Aneroid, 2 inches diameter, altitude scale to 15,000 feet, by each 100 feet.....	19.00	.20
3304.	Pocket Aneroid, 2 inches diameter (nickel case and omitting morocco case) altitude scale to 6,000 feet, by each 50 feet.....	22.00	.20

No.		PRICE	Post.
3306.	Pocket Aneroid, $2\frac{3}{4}$ inches diameter, altitude scale to 10,000 feet, by each 50 feet, with thermometer, and opposite side with pocket-compass..	\$27.00	\$0.30
3308.	Pocket Aneroid, $2\frac{3}{4}$ inches diameter, altitude scale to 16,000 feet, by each 50 feet, with thermometer and opposite side with pocket-compass ..	29.00	.30
3310.	Pocket Aneroid, $2\frac{3}{4}$ inches diameter, altitude scale to 8,000 feet, by each 10 feet	19.00	.25
3312.	Pocket Aneroid, $2\frac{3}{4}$ inches diameter, altitude scale to 5,000 feet, by each 20 feet ..	18.00	.25
3314.	Pocket Aneroid, $2\frac{3}{4}$ inches diameter, altitude scale to 10,000 feet, by each 50 feet ..	19.00	.25
3316.	Pocket Aneroid, $2\frac{3}{4}$ inches diameter, altitude scale to 16,000 feet, by each 50 feet ..	20.00	.25
3318.	Pocket Aneroid, $2\frac{3}{4}$ inches diameter, altitude scale to 20,000 feet, by each 100 feet.....	22.00	.25
3322.	Pocket Aneroid, $2\frac{3}{4}$ inches diameter, altitude scale to 10,000 feet, by each 50 feet, and thermometer..	22.00	.25
3324.	Pocket Aneroid, $2\frac{3}{4}$ inches diameter, altitude scale to 16,000 feet, by each 50 feet, and thermometer..	23.00	.25
3329.	Pocket Metric Aneroid, $2\frac{3}{4}$ inches diameter, altitude scale to 1,500 meters, reading to 5 meters, and pressure scale reading to $\frac{1}{2}$ millimeter ..	18.00	.25
3330.	Pocket Metric Aneroid, $2\frac{3}{4}$ inches diameter, altitude scale to 3,000 meters, reading to 10 meters, and pressure scale reading to 1 millimeter....	19.00	.25
3332.	Pocket Metric Aneroid, $2\frac{3}{4}$ inches diameter, altitude scale to 5,000 meters, reading to 20 meters, and pressure scale reading to 2 millimeters ..	20.00	.25
3336.	Plain Aneroid, no altitude scale, 5 inches diameter, with thermometer and open face to show mechanism, for parlor use ..	15.00	
3338.	Plain Aneroid, no altitude scale, $6\frac{1}{2}$ inches diameter, and with two thermometers reading to scales of Fahrenheit, Reaumur and Celsius, and open face to show mechanism, for parlor use....	18.00	
3340.	Self-Recording Aneroid Barometer, with attached thermometer In mahogany case with glass front.	50 00	

The cylinder makes a complete revolution in seven days, and thus each diagram gives a barometric record for one week.

NOTE.—The graduated spaces on the altitude scales of Barometers No 3300 to 3332 can be subdivided by the eye or by using a magnifier and thus obtain a closer reading than advertised.

A leather sling case for Barometers Nos. 3306 to 3332, and omitting the morocco case, costs extra \$1.50.

SURVEYING AND MINING ANEROIDS.

BRONZED CASES, SILVERED DIALS WITH REVOLVING MAGNIFIER COM-
PENSATED FOR TEMPERATURE. IN LEATHER SLING CASES.

No.		PRICE.	Post
3350.	Surveying Aneroid, 3 inches diameter, altitude scale to 6,000 feet, by each 20 feet and by vernier to 2 feet	\$42.00	\$0.40
3352.	Surveying Aneroid, 3 inches diameter, with altitude scale to 10,000 feet, by each 50 feet and by vernier to 5 feet	45.00	.40
3354.	Surveying Aneroid, 3 inches diameter, with altitude scale to 15,000 feet by each 50 feet and by vernier to 5 feet.....	48.00	.40
3355.	Mining Aneroid, 3 inches diameter, arranged to register 2,000 feet below sea-level to 4,000 feet above by each 20 feet and by vernier to 2 feet	42.00	.40
3360.	Surveying Aneroid, 5 inches diameter, with altitude scale to 5,000 feet by each 10 feet and by vernier to 1 foot	50.00	
3362.	Surveying Aneroid, 5 inches diameter, with altitude scale to 10,000 feet by each 20 feet and by vernier to 2 feet.....	52.00	
3364.	Surveying Aneroid, 5 inches diameter, with altitude scale to 15,000 feet by each 20 feet and by vernier to 2 feet.	54.00	
3366.	Surveying Aneroid, 5 inches diameter, with altitude scale to 20,000 feet by each 50 feet and by vernier to 5 feet.. .. .	57.00	

The Surveying and Mining Aneroid has been constructed especially for the use of Surveyors and Engineers, for ascertaining slight variations in gradients, levels, etc., and from its extreme sensitiveness will be found of considerable utility in Mining and Surveying work generally

The Vernier Scale is moved by rack and pinion, and the magnifier which rotates on the outer circumference of the instrument facilitates the reading of the vernier.

A Treatise on the Aneroid Barometer; its construction and use. Illustrated. 50 cents.

TO USE THE ANEROID, WITH ALTITUDE SCALE.

Find the height in feet at first station and subtract this from the height in feet at second station. If the mean temperature is greater or less than 50° F., apply correction for temperature as hereafter given.

Example :

Aneroid at Station A, 1800 feet. Thermometer, 50°.
Aneroid at Station B, 800 feet. Thermometer, 70°.

The approximate height is 1,000 feet. The sum of the temperatures is 120. A correction of + 20 is therefore applied. This is 20 feet.
The difference of elevation is therefore $1,000 + 20 = 1,020$ feet.

TO FIND THE RELATIVE HEIGHT OF TWO GIVEN PLACES.

Take a reading of the Aneroid at first station ; subtract from this the reading at second station. The product multiplied by 9 will give the difference of altitude in feet thus :

First Station, 30 20 ; Second Station, 29.99 ; $30.20 - 29.99 = .21$;
.21 x 900 (or 21 x 9) = 189 feet = difference of altitude.

This under ordinary pressures and with a temperature about 50° F. will give good results. If the temperature is over 70° F. multiply by 10.
The table prepared by Mr. Symons is more strictly accurate :

MEAN TEMPERATURE.	30°	40°	50°	60°	70°	80°
Mean pressures, 27 inches...	9 7	9.9	10.1	10.3	10 5	10.8
Mean pressures, 28 inches ..	9.3	9.5	9.8	10.0	10.2	10.4
Mean pressures, 29 inches...	9 0	9.2	9.4	9 6	9 8	10.0
Mean pressures, 30 inches...	8 7	8.9	9.1	9 3	9.5	9.7

Roughly speaking, the barometer falls one inch for every 900 feet of ascent ; or at mean atmospheric pressure in this latitude,

Above sea-level 917 feet, the barometer falls..... 1 inch.
Above sea-level 1860 feet, the barometer falls..... 2 inches.
Above sea-level 2830 feet, the barometer falls 3 inches.
Above sea-level 3830 feet, the barometer falls. 4 inches.
Above sea-level 4861 feet, the barometer falls..... 5 inches.

ANEMOMETERS.

FOR MEASURING THE PRESSURE AND VELOCITY OF CURRENTS OF AIR IN COAL MINES, AND VENTILATORS, FLUES, ETC., OF PUBLIC BUILDINGS.

"Biram's."—For registering the velocity of currents of air in mines, tunnels, etc., by means of a light fan, the revolutions of which are recorded on a dial in the center of the instrument.

This instrument placed in the passage of a mine registers automatically the rate at which the air is traveling through it, and a simple observation will detect any slackening of the current arising from obstruction of the ways, or want of attention at the ventilating furnace, or fan-wheel.

**3380.**

No.		PRICE.	POST.
3380.	Biram's Anemometer, 3 inches diameter, reading to 1,000 feet, with disconnector, in morocco case....	\$19.00	\$0.30
3382.	Biram's Anemometer, 4 inches diameter, reading to 1,000 feet, with disconnector, in wood case.....	19.00	.40

3386.	Biram's Anemometer, 6 inches diameter, reading to 100,000 feet, with disconnector, in wood case.....	22.00	.60

No.	PRICE.	POST.
3388. Biram's Anemometer, 6 inches diameter, reading to 10,000,000 feet, with disconnector, in wood case	\$30 00	\$0.60
3390. Biram's Anemometer, watch pattern, hunting-case, very sensitive, reading to 1,000 feet.	26.00	.18

Pocket Size (*2 inches diameter*)—Is made in the form of a watch—the top and bottom of the case, when opened, form a base for the instrument, a check-spring passing through the pendant acts as a stop to the movement, on being pressed by the finger at the expiration of the time necessary to make the observation. The movement is jeweled at four points. The outer circle of divisions on the dial records by single feet up to one hundred; the smaller dial continues the enumeration up to one thousand feet.

HOW TO USE THE ANEMOMETER.

The Anemometer consists of a series of vanes, which revolve with the action of the air-current, the number of revolutions, or numbers proportioned to the revolutions, being registered by a pointer on the face of a dial, forming part of the instrument itself. An observer has only to record the position of the several indices at the first observation (by writing the lower of the two figures on the respective circles, between which the index points, in their proper order), and deduct the amount from their position at the second observation, to ascertain the velocity of the air which has passed in the interval. This multiplied by the area in feet of the passage, where the instrument is placed will show the number of cubic feet which has passed during the same period.

Thus, suppose the observation of one minute gives :

Second reading.....	525
First reading.....	225
	<hr/>
	300
Add correction, say.....	30
	<hr/>
	330

Size of passage in feet, $10 \times 5 \times 330 = 16,500$ feet per minute.

The correction added above is the value of the constant of friction, which must be found for each machine by actual experiment.

TO FIND THE VELOCITY OF THE AIR IN THE PASSAGE.

Proceed thus : Suppose the Anemometer indicates 330 feet per minute. $330 \div 88 = 3.75$, or $3\frac{3}{4}$ miles per hour, 88 being $\frac{1}{10}$ th of a mile.

To ascertain the force of the air-current, multiply the square of the velocity of the air in feet per second by .0023.

AIR-METERS.

3397.

No.		PRICE.	Post.
3396.	Air-Meter, with disconnector, fan-wheel $2\frac{3}{4}$ in. diameter, two dials reading to 1,000 feet.....	\$19.00	\$0.35
3397.	Air-Meter, with disconnector, fan-wheel $2\frac{3}{4}$ in. diameter, six dials reading to 10,000,000 feet.....	21.00	.35

The portable "*Air-Meter*" is for the measurement of currents of air through mines, tunnels, sewers and the ventilators of hospitals, public buildings, etc. The indications are obtained by means of a delicately poised fan-wheel, the recordings being commenced by the long hand, which traverses the extreme outer circumference of the main dial for the passage of one hundred feet of air. The enumeration is continued up to ten millions of feet (say 1,894 miles), by a series of smaller dials as shown in the illustration. A "Disconnector" projecting from the band of the instrument, opposite the fan-wheel, serves to throw the mechanism out of gear, and arrest its action, when required. The instrument is packed, with universal jointed socket-holder, in a box about four inches square.

FIELD-GLASSES AND BINOCULAR TELESCOPES.

The Field-Glasses here described are of the best quality and especially adapted for tourists, engineers, military service, or general field use. They are achromatic, and are metal body covered with morocco, and have a case with strap. Some are designated by the diameter of the object-glasses in French lines, eleven lines being equal to one inch.

No. 3400.

No. 3442 with focusing attachment.

ACHROMATIC TELESCOPES.

3475.

No.		PRICE.	POST.
3475.	Telescope, with 3 draws, 15 inches drawn out, 6 inches shut, object-glass 1 inch in diameter, power 13 times.....	\$2.50	\$0.20
3476.	Telescope, with 3 draws, 16 inches drawn out, 6 inches shut, object-glass $1\frac{1}{8}$ inches in diameter, power 16 times.....	3.50	.25
3477.	Telescope, with 3 draws, 23 inches drawn out, 8 inches shut, object-glass $1\frac{3}{8}$ inches in diameter, power 20 times.....	5.00	.30
3478.	Telescope, with 3 draws, 30 inches drawn out, 10 inches shut, object-glass $1\frac{5}{8}$ inches in diameter, power 25 times.....	7.00	.40
3479.	Telescope, with 4 draws, 37 inches drawn out, 11 inches shut, object-glass $1\frac{7}{8}$ inches in diameter, power 35 times.....	10.00	.65
3480.	Telescope, with 4 draws, 42 inches drawn out, 11 $\frac{1}{2}$ inches shut, object-glass $2\frac{1}{8}$ inches in diameter, power 40 times.....	17.00	.85
3481.	Telescope with 4 draws, 48 inches drawn out, 13 $\frac{1}{2}$ inches shut, object-glass $2\frac{3}{8}$ inches in diameter, power 50 times.....	30.00	

3485. (See page 412.)

TOURISTS' ACHROMATIC TELESCOPES.

No.		PRICE	Post.
3485.	Telescope, with brass body covered with morocco; three draws, 17 inches drawn out, 6 inches shut; object-glass $1\frac{1}{2}$ inches in diameter; sun-shade; leather caps to cover eyepiece and object-glass and shoulder strap. Power 20 times.....	\$8 00	\$0.20
3486.	Telescope, same as No. 3485, but is 21 inches drawn out, 7 inches shut; object-glass $1\frac{3}{8}$ inches in diameter. Power 25 times.....	11.00	.30
3487.	Telescope, same as No. 3485, but is 24 inches drawn out, 9 inches shut; object-glass $1\frac{3}{4}$ inches diameter. Power 30 times.....	15.00	.40
3488.	Telescope, same as No. 3485, but has four draws, 36 inches drawn out, 10 inches shut; object-glass 2 inches in diameter. Power 35 times.....	22 00	.60
3492.	Rifle Spy-glass, $10\frac{3}{4}$ inches drawn out; body covered with morocco; object-glass $\frac{1}{2}$ -inch in diameter. Power 10 times	2.50	.15
3494.	Wooden Tripod Stand, with vertical and horizontal motion, upon which to place a telescope; a useful article, as a telescope of much power can not be held in the hand with sufficient steadiness.....	5.00	
3496.	Brass Clamp with Gimlet Screw, to fasten a telescope to a post or tree; sizes to fit telescopes Nos. 3475 to 3488. Price according to size \$1.50, 2.00, 2.50 3.00, 4.00 and	5.00	.15

ASTRONOMICAL TELESCOPES.

		PRICE.
3502.	Astronomical Telescope, polished brass body, 35 inches long, mounted on brass tripod stand, achromatic object-glass $2\frac{3}{4}$ inches in diameter, one terrestrial eyepiece, power 50 times, one celestial eyepiece, power 100 times, rack and pinion for focusing. In box with lock.....	\$75.00
3506.	Astronomical Telescope, polished brass body, 35 inches long, rack and pinion for focusing, achromatic object-glass, $2\frac{1}{2}$ inches in diameter, terrestrial eyepiece, power 40 times, celestial eyepiece with darkener, power 80 times, wooden tripod with horizontal and vertical motion. In box with lock, for receiving the body and eyepieces...	75.00
3508.	Astronomical Telescope. Same as No. 3506, but with body 40 inches long, achromatic object-glass 3 inches in diameter, terrestrial eyepiece, power 55 times, celestial eyepiece with darkener, power 110 times. In box with lock.....	100.00

SCIENTIFIC BOOKS

FOR SALE BY

W. & L. E. GURLEY,

TROY, N. Y., U. S. A.

Architecture, Carpentry and Building, Astronomy, Bridges,
Roofs and Tunnels, Chemistry and Physics, Construction,
Strength of Materials, Drawing, Electricity and Telegra-
phy, Geology, Mining and Metallurgy, Hydraulic and
Sanitary Engineering, Machinery and Mechan-
ics, Pocket Table-Books, Surveying and
Engineering-Instruments, Etc.

NOTE.— Parties ordering should either send drafts on New York, or postal orders on Troy, N. Y.; or if money is enclosed in letters, such letters should be registered at the post-office where mailed.

We prepay postage on nearly all American and English Books when the price is sent to us in advance.

Books can be registered at an extra cost of eight cents for each package of not over four pounds.

Orders for over \$10 will be sent by express "C. O. D." if desired; but for smaller sums, parties will please remit the necessary amount with their order.

Write all letters legibly, give your Post-office, County and State, and be sure to sign your letter before mailing.

We are not responsible for loss of goods sent by mail.

Should any other works on kindred topics be desired, we will furnish them at publishers' prices.

Our prices for books are for the latest editions published.

- 3.—Practical Designing of Retaining Walls. By Arthur Jacob, C. E.
- 4.—Proportion of Pins Used in Bridges. By Chas. E. Bender, C. E.
- 5.—Ventilation of Buildings. By W. F. Butler.
- 6.—Designing and Construction of Reservoirs. By A. Jacob, A. B.
- 7.—Surcharged and Different Forms of Retaining Walls. By Jas. S. Tate, C. E.
- 11.—Theory of Arches. By Prof. W. Allan.
- 12.—Theory of Voussoir Arches. By Prof. W. E. Cain.
- 13.—Gases met with in Coal Mines. By J. J. Atkinson.
- 14.—Friction of Air in Mines. By J. J. Atkinson.
- 15.—Skew Arches. By Prof. E. W. Hyde.
- 17.—Water and Water Supply. By Prof. W. H. Corfield.
- 18.—Sewerage and Sewage Purification. By W. N. Baker, Ph. B.
- 19.—Strength of Beams under Transverse Loads. By Prof. W. Allan.
- 20.—Bridge and Tunnel Centers. By E. S. Gould, C. E.
- 22.—High Masonry Dams. By John B. McMaster, C. E.
- 23.—Fatigue of Metals under repeated Strains. From the German of Prof. Spangenburg, with a Preface by S. H. Shreve, A. M.
- 25.—Theory and Calculation of Continuous Bridges. By M. Merriman, Ph. D.
- 26.—Practical Treatise on Continuous Bridges. By Charles Bender, C. E.
- 31.—Sanitary Condition of Dwelling Houses. By Geo. E. Waring, Jr.
- 32.—Cable Making of Suspension Bridge. By Hildenbrand, C. E.
- 33.—Mechanics of Ventilation. By Geo. W. Rafter, C. E.
- 34.—Foundations. By Prof. Jules Gaudard, C. E.
- 35.—Aneroid Barometer: Its Construction and Use. By Geo. W. Plympton.
- 37.—Geographical Surveying. By Frank De Yeaux Carpenter, C. E.
- 38.—Maximum Stresses in Frame Bridges. By Prof. W. E. Cain, A. M.
- 40.—Transmission of Power by Compressed Air. By R. Zahner, M. E.
- 41.—Strength of Materials. By Wm. Kent, C. E.
- 42.—Voussoir Arches Applied to Stone Bridges, Tunnels, Culverts, Groined Arches, and Domes. By Prof. W. E. Cain, C. E.
- 44.—Turbine Wheels. By Prof. W. P. Trowbridge.
- 48.—Theory of Solid and Braced Arches. By W. E. Cain, C. E.
- 50.—Dwelling Houses; their Sanitary Construction and Arrangements. By Prof. W. H. Corfield.

No

- 55.—Sewer Gases ; their Nature and Origin By A de Varona
- 56.—Actual Lateral Pressure of Earthwork By Benj Baker, C E.
- 58.—Ventilation of Coal Mines By W Fairley.
- 59.—Railroad Economics By S W. Robinson, C. E.
- 60.—Strength of Wrought Iron Bridge Members By S W. Robinson, C. E
- 61.—Potable Water : and Methods of Detecting Impurities By Chas W. Folkard.
- 63 — House Drainage and Sanitary Plumbing By W P. Gerhard, C E.
- 65 — Pocket Logarithms to Four Places of Decimals.
- 67.—Hydraulic Tables By P. J Flynn, C E
- 72 — Topographical Surveying By Geo J Specht, Prof A S. Hardy, John B McMaster and H. F. Walling.
- 74 — Testing Machines, their History, Construction and Use By Arthur V Abbott
- 77 — Stadia Surveying and Stadia Measurements. By A. Winslow.
- 80.—Healthy Foundations for Houses By Glenn Brown.
- 81 — Water Meters : Comparative Tests of Accuracy, Delivery, etc. By Ross E Browne
- 82 — Preservation of Timber by the Use of Antiseptics. By S. B. Boulton, C. E
- 83 — Mechanical Integrators. By Prof. Henry S. H Shaw, C. E.
- 84 — Flow of Water in Open Channels, Pipes, Conduits, Sewers, etc ; with Tables By P. J Flynn, C. E.
- 87 — Treatise on the Theory of the Construction of Helicoidal Oblique Arches. By John L. Culley, C E
- 88.—Beams and Girders. Formulas for their Resistance. By Prof P H. Philbrick.
- 91.—Leveling ; Barometric, Trigonometric, and Spirit. By Prof. I. O. Baker
- 93.—Notes Embodying Recent Practice in the Sanitary Drainage of Buildings By Wm. Paul Gerhard, C E
- 94.—Treatment of Sewage. By Dr. C. Meymott Tidy.
- 95.—Plate Girder Construction. By Isami Hiroi, C. E
- 100.—How to Become an Engineer By G W Plympton, C. E.
- 101.—The Sextant and other Reflecting Mathematical Instruments By F. R. Brainard, U. S. Navy
- 104.—Van Nostrand's Table Book for Civil and Mechanical Engineers. Compiled by Prof Geo. W. Plympton.
- 107.—Graphical Method for Swing-Bridges By B F La Rue, C. E
- 110.—Transition Curves. By W. G. Fox
- 114.—Manual of the Slide-Rule By F. A. Halsey.
- 115.—Traverse Table, for distances between 1 and 100, and for every quarter degree up to 90 degrees.

Any of the "Science Series" not mentioned in the above list will be furnished promptly on application.

THE RENSSELAER POLYTECHNIC INSTITUTE TROY, N. Y.

A SCHOOL OF ENGINEERING AND SCIENCE.

FOUNDED IN 1824.

It is the aim of the Institute to maintain the most thorough course of engineering in this country. Its methods of instruction are the result of an experience unequalled by that of any similar school in the world. The Course of Study pursued, while not beyond the capacity of young men of average ability, is constantly adjusted to the progress of the engineering profession. Its purpose is to equip students to enter upon a general engineering practice and to specialize later as opportunities open before them. That the plan has been attended with unqualified success is shown by the Register issued annually, containing the business address of each living graduate. Among them will be found men eminent in every branch of engineering. It is, moreover, the method of instruction pursued for other professions.

It should be stated, perhaps, that Civil Engineering is understood to include instruction in Road and Bridge Construction, Hydraulics, Steam and Electrical Engineering, Mining Engineering and Assaying.

The studies of the course are designed as a professional preparation, at once thorough and practical, for the following specialties of engineering practice :

The location, construction, and superintendence of public works, as steam and electric railways, canals, water works, etc.; the design, construction and management of mills, iron works, steel works, chemical works, and pneumatic works; the design and construction of roofs, arch bridges, girder bridges, and suspension bridges; the survey and superintendence of hydraulic motors, air engines, electric motors, and the various kinds of steam engines; the design, construction and use of machines in general, and the determination of their efficiency; the survey of rivers, lakes and harbors, and the direction of their improvements; the determination of latitude, longitude, time and the meridian in geographical explorations, or for other purposes, together with the projection of maps; the selection and test of materials used in construction; the construction of the various kinds of geometrical and topographical drawings.

A course of study is also pursued in the Institute embracing more advanced instruction in Natural History, Chemistry and Geology, leading to the degree of Bachelor of Science. The first two years are identical with the course in Civil Engineering.

Special students in all courses, particularly in chemistry and electrical engineering, are also received.

There are two terms in the scholastic year and the tuition is \$100 per term. Other expenses are largely within the control of individual students. Every effort is made by the management to keep necessary expenses within the narrowest limits, consistent with the best opportunities to students, and they have been materially reduced within the last few years.

Any one desiring a thorough course of study in preparation for advanced professional work in any department of

engineering is invited to apply for further information to the President of the Institute.

"The greatest number of the renowned hydraulic and railroad engineers of America are graduates of this school" — *From the report to his government of Professor A. Riedler of the Royal Polytechnicum, at Berlin. (Report U. S. Commissioner of Education 1892-'93)*

This famous Institute is by no means local, as the freshman list this year contains the names of students from twenty-two States of the Union, as well as from Cuba and South America, and the graduates are leading men in engineering and in business all over the world — *The Railroad Gazette, February 22, 1901*

ROADS,
 RAILROADS,
 BRIDGES,
 ARCHES,
 DAMS.
 STEAM ENGINES,
 ELECTRIC ENGINES,
 DYNAMOS,
 TURBINES.
 FOUNDATIONS,
 WATER WORKS,
 TUNNELS,
 SEWERS,
 RIVERS,
 CANALS.
 CHEMICAL ANALYSIS,
 MINERALOGY,
 METALLURGY,
 ASSAYING.

TABLE OF CONTENTS.

	PAGE.
Abney Level and Clinometer.....	231, 275
Adjustment of Architects' Level .. .	169
Adjustment of Drainage Level	173
Adjustment of Engineers' Y-level .. .	159-164
Adjustment of Engineers' and Surveyors' Transits.	19-23
Adjustment of Line of Collimation.....	20, 21, 126, 161
Adjustment of Object-glass Slide... ..	23, 159, 160
Adjustment of Solar Attachment	85-88
Adjustment of Solar Compasses	98-100, 134
Adjustment of Surveyors' Compasses	115-117
Adjustment of Telescopic Sight.....	125-127
Air-Meters.....	406-408
Alidades for Plane-Tables	200-204, 274
Alt-Azimuth	895
Alteneder Drawing-Instruments	302-307
Aluminum Instruments	150, 247, 265
Anemometers.....	406-408
Aneroid Barometers	402-405
Angle-Mirrors.....	898
Architects' Levels.....	167-171, 266
Artificial Horizon	898
Astronomical Telescopes	412
Astronomical Terms	89-95
Attachments and Extras for Compasses	129, 130, 142, 262, 263
Attachments and Extras for Transits	48-69, 260, 261
Ball-Spindle	108, 122, 262
Barometers, Aneroid	402-405
Batson Sketching-Case	205-209, 275
Battery for Current-Meters	216, 275
Blowpipes.....	418
Blue-Print Paper, Print-Frames and Bath-Trays.. .	365-367
Books (blank) for Field-Notes.....	374-376
Books, Scientific, for Architects, Draftsmen, Engineers and Surveyors.....	421-436
Boxes and Cases for Compasses, Levels and Transits.....	252, 253, 268
Boxes and Cases for Drawing-Instruments	294, 307
Boxwood Rules and Scales... ..	335-342
Bristol-Board.....	362
Bronze Finish.....	245
Brushes for Water-Colors.....	388, 389
Builders' Transit.....	44, 45, 260

	PAGE.
Celluloid or Amber Goods	331, 332, 345, 346, 348, 352, 354, 358
Center Pin.	119
Chains, American	233-235, 276
Chains, Metric and Vara .. .	236, 277
Chain-Tapes.....	237-239, 278
Clamp and Tangent.	14, 53, 55, 130, 260, 263, 264
Clinometers.....	144, 145, 231, 265, 394, 395, 400, 401
Colors, Windsor & Newton's	383, 385-387
Compass Attachments for Levels.	152, 266
Compasses, Clinometer	144, 145, 265
Compasses, Dial.....	148-150, 265
Compasses, Extras for.....	129, 130, 142, 262, 264
Compasses, Geologists' .. .	143, 265
Compasses, Miners' Dip-Needle.. ...	146, 147, 265
Compasses, Plain.....	121-123, 142, 262, 264
Compasses, Pocket	132-150, 263-265, 392-396
Compasses, Prismatic.....	395, 396
Compasses, Railroad .. .	103-107, 262-264
Compasses, Solar.....	97-102, 132-134, 261, 263
Compasses, Vernier... ..	108-120, 139-141, 262, 264
Compound, Tangent Ball-Spindle	122, 262
Crayon Pencils and Lumber Clayons .. .	377, 378
Cross-Section Books and Paper .. .	368, 370-372, 376
Cross-Staff Heads	398
Cross-Wires.....	8-11, 250, 252, 253
Current-Meters	211-225, 275
Current-Meter-Reduction-Tables .. .	217, 220, 224
Curves of Amber, Rubber and Wood. ..	357, 359
Declination Arc .. .	62, 86, 133
Declination of Magnetic Needle.....	112-114
Declination of the Sun	65, 75, 76, 90
Detachable Telescopes for Transits.. ..	58, 261
Diagonal Prism for Eyepiece of Telescopes ..	59, 261
Dial Compasses.....	148-150, 265
Dip-Needle Compasses.....	146, 147, 265
Diurnal Variation .. .	114
Drainage Levels .. .	172-174, 266
Drawing-Boards and Tables .. .	349, 350
Drawing-Instruments, Alteneder	302-307
Drawing-Instruments, Brass.....	322-326
Drawing-Instruments, German.....	308-326
Drawing-Instruments, Nickel-plated.....	324-326
Drawing-Instruments, Pivot-Joint.....	297-307
Drawing-Instruments, Swiss .. .	286-301, 327-329
Drawing-Paper .. .	362-365, 368-372
Dust-Guard for Object-glass Slide of Telescopes.....	12, 152, 255, 261

	PAGE
Electric Current-Meter	222-224, 275
Electric Register.	212, 216, 275
Electricity..	118
Ellipses.....	358
Empty Cases for Instruments.....	252, 253, 268, 294, 307
Engineers' Levels.	152-166, 266
Engineers' Transits.....	6, 25-28, 256, 257
Erasing-Knives and Erasing-Rubber	379-381
Excavation and Embankment Tables	376, 430, 431
Extras for Compasses....	129, 130, 142, 262-264
Extras for Transits	48-69
Eyepiece of Telescope, how composed ..	5-7
Eyepiece for Transit and Level Telescope ...	5, 7, 252, 253
Field Glasses and Telescopes for Tourists.....	409-412
Flagstaff or Ranging-Pole ..	191, 271
Foreign Shipments.....	246, 247
Geologists' Compass	143, 265
Gradiometer ...	56, 57, 260
Graduations of Limb and Vertical Circle ..	16, 254, 261
Hand-Levels	228-231, 275
Hook-Gauge, Boyden's.....	226-227, 275
Hour-Circle and Hour-Arc ..	62, 87, 134, 265
Hydrometers	420
Hygrometer	419
Hyperbolas	358
India Ink.....	383, 384
Information to Purchasers.....	241-251
Ink-Slabs and Color-Saucers	389, 390
Ink for Drawing or Writing	365, 373, 383, 384
Inverting Eyepiece	7
Ivory Rules and Scales.....	334-336, 341
Lacquering	245
Latitude Arc.....	62, 83, 84, 133, 261
Latitude-Level.....	82, 261
Leather Cases and Pouches.....	180, 268
Level on Telescope	53, 54, 130, 260, 263
Level Vials and Spirit Levels.....	14, 19, 109, 115, 119, 156, 416, 417
Leveling Adaptor	122, 142, 262, 264
Leveling-Instruments, Architects' Levels.....	167-171, 266
Leveling-Instruments, Drainage	172-174, 266
Leveling-Instruments, Y-Levels.....	152-171, 266
Leveling-Rods	181-191, 269-271

	PAGE.
Leveling Tripod Head.....	17, 25, 123, 158, 255, 261, 262, 264
Line of Collimation	20, 21, 126, 161
Locke's Hand-Level.....	230, 275
Magnetic Needle.	18, 66, 101, 106, 112, 115, 116, 118
Magnets	418
Magnifiers.....	55, 261, 418-415
Magnifying Power of Telescopes.	7, 8
Marking-Pins and Timber-Scribe	237, 277
Meters, Current	211-225, 275
Metric Aneroid Barometers.....	403
Metric Chains and Tapes	236, 239, 277, 282
Metric Leveling-Rods and Poles	190, 191, 270, 271
Metric Paper for Draftsmen.....	370-372
Metric Rules and Scales.....	340, 344
Miners' Dip-Needle Compasses.....	146, 147, 265
Miscellaneous.....	253
Mountain Transits.....	29-32, 258
Mucilage	382
Object-glass of Telescopes	5, 252, 258
Odometers.....	399, 400
Offset-Standard.....	128, 263
Oilstones.....	417
Opera and Field-Glasses	409, 410
Optical Axis.....	9, 10, 127
Optical Principles of Telescope	5, 7
Outkeeper.....	111
Packing, etc.....	244, 255
Pantographs.....	361
Paper-Cutter.....	373
Paper, Drawing and Tracing.....	362-365, 368-372
Parabolas.....	358
Parallel Rulers.....	360, 361
Parchment-Paper	364, 365
Parts of Instruments liable to injury, prices of.....	252, 253
Passometers.....	399
Payment, Terms of.....	246, 251
Pedometers.....	399
Pencils.....	377
Pencil-Sharpeners	379
Pens, Mapping and Writing.....	318
Plain Compasses	121-123, 142, 264
Plane-Tables	193-204, 272-274
Planimeters.....	294, 295
Platinum Cross Wires.....	8-11, 250, 252, 253, 255, 261

	PAGE.
Plummet-Lamp	60, 261
Plummet	253, 267
Pocket-Compasses	132-150, 263-265, 392-396
Pocket-Levels	416
Polar Axis	86, 87
Price-List.	252-436
Prismatic Compasses.. . . .	395, 396
Profile-Books and Paper	369, 370, 374
Protractors of Boxwood, Brass, Celluloid, German Silver, Horn, Ivory, Paper, Rubber, and Wood.. . . .	327-335
Protractors, Limb, long steel blade	329, 330
Quick-Leveling Attachment	261
Rack and Pinion.	156, 261, 264
Railroad Compasses.. . . .	103-107, 135-138, 262-264
Rain-Gauge and Water-Gauge	420
Ranging-Poles	191, 271
Reading-Glasses and Magnifiers	413-415
Reconnaissance Transit	42, 43, 259
Reflecting Mirrors and Prisms.... .	398
Reflectors for Cross-Wires and Limb of Transits.. . . .	16, 59, 255, 261
Refraction	69, 94
Refractions, Table of	70-74
Rensselaer Polytechnic Institute	437-439
Repairs to Instruments	248-253
Rod-Level.	192-271
Rods, Leveling.. . . .	181-191, 269-271
Rubber Goods	345-347, 352, 354, 357-360, 379-381
Scales of Boxwood, Ivory, Paper and Metal	334-344
Section-Liners	355, 356
Selection of Instruments	241
Sextants.. . . .	397
Shifting Center for Leveling-Head of Transits.	17, 254
Sights on Standards and on Telescope of Transits	55, 261
Sizes of Compasses.. . . .	107, 120, 121, 140
Sizes of Levels.....	167
Sizes of Transits	27, 36, 40, 47
Sketching-Case, Batson.....	205-209, 275
Sketch-Blocks (paper).. . . .	368
Slide Rules	342, 343
Slope-Levels.. . . .	400, 401
Sockets of Levels.....	154, 158
Sockets of Transits	15, 16, 17, 29, 33, 35, 39
Solar Attachment for Transits.....	27, 28, 61-69, 261
Solar Compasses.....	97-102, 132-134, 261, 263

	PAGE
Solar Screen.....	81, 261
Solar Transits	27, 28, 31, 40, 41, 257-259
Special Notices	241-251, 254, 255, 284, 285
Spirit-Levels	14, 19, 109, 115, 119, 156, 416, 417
Spring-Balance for Chains and Tapes	281
Stadia Rods	188, 270
Stadia Wires	10, 11, 250, 252, 253, 255, 261
Staff Mountings	109, 252
Steel Rules	344
Steel Tapes	237-239, 278, 280-283
Stencil-Alphabets and Figures	390, 391
Straight-Edges of Amber, Rubber, Wood and Steel	344-346
Striding-Level	86, 261
Surveyors' Cross-Staff Head	398
Surveyors' Transits.....	33, 43, 258-260
Tables, Drawing.....	349, 350
Tables, Plane	193-204
Tables, Reduction (for Current-Meters)	217, 220, 224
Tables, Traverse (books)	430, 431, 436
Tacks for Drawing-Boards.....	373
Tally-Register	399, 400
Tangent Scale on Sight-Vanes.. ..	109
Tape-Lines, Metallic	238, 279
Tape-Lines, Steel	237-239, 278, 280-283
Telescope, how composed ..	5-7, 152
Telescopes and Tourists' Glasses	409-412
Telescopes for Vertical Sighting.....	58, 261
Telescopic Sight Attachment.....	124-130, 264
Thermometers	418, 419
Timber-Scribe, or Marking-Iron.....	277
Time-Recorder for Current-Meters.. ..	215, 275
Tin-Tubes, for Drawing-Paper	368
Tracing-Cloth and Paper.....	365
Trammel Points.....	417, 418
Transit-Instruments, Remarks on	5-23
Transits, Attachments for	48-69, 260, 261
Transits, Builders'	44, 45, 260
Transits, Engineers'	6, 25-28, 256, 257
Transits, Light Mountain and Mining	29-32, 258
Transits, Reconnoissance	42, 43, 259
Transits, Solar	27, 28, 31, 40, 41, 257-259
Transits, Solar Attachment for.....	27, 28, 61-69, 261
Transits, Surveyors'	33-43, 258-260
Transits, Vernier	46, 47, 260
Transportation	245
Traverse-Tables (books).....	430, 431, 436

	PAGE
Traverse-Table Board and Tripod... ..	203, 274
Trial of Instruments..	243
Triangles of Amber, German Silver, Rubber, Steel and Wood. .	351-354
Tripods..... .	18, 176-179, 195, 266, 267
T-Squares of Amber, Rubber, Steel and Wood	346-348
 Vera Chains and Tape-Lines... ..	236, 239, 277
Variation Arc of Transits	14, 254, 260
Variation of the Needle	106, 112-114
Vellum or Tracing-Cloth.	365
Verniers.... .	15, 112
Vernier Compasses..	108-120, 139-141, 262, 264
Vernier Protractors	328-332
Vernier Transit-Compasses	46, 47, 260
Vertical Arc and Vertical Circle	49-52, 130, 254, 260, 263
 Warranty..... .	242
Water-Colors.	383, 385-387
Water-Glasses	389
Weights of Compasses	102, 107, 120, 122, 138, 140
Weights of Levels.. . . .	167
Weights of Transits..... .	27, 32, 36, 40, 42, 45, 47
